1 BE IT REMEMBERED that the above-entitled and
2 numbered matter came on to be heard at a Special Open
3 Meeting before the Arizona Corporation Commission, in
4 Hearing Room 1 of said Commission, 1200 West Washington
5 Street, Phoenix, Arizona, commencing at 10:13 a.m. on
6 the 9th of April, 2010.

8 BEFORE: KRISTIN K. MAYES, Chairman
9 GARY PIERCE, Commissioner
10 PAUL NEWMAN, Commissioner
11 SANDRA D. KENNEDY, Commissioner
12 BOB STUMP, Commissioner

13 PARTICIPANTS:

14 For APS:

15 Mr. Robert Lotts
16 Mr. Jeff Guldner
17 Mr. James Wilde
18 Mr. Patrick Dinkel

19 For TEP/UNS:

20 Mr. Phil Dion
21 Mr. Erik Bakken, appearing via teleconference
22 Mr. Mark Mansfield, appearing via teleconference
23 Mr. Andy Hoekstra, appearing via teleconference

24 For AEPCO:

25 Mr. James Andrew

1 PARTICIPANTS:

1 CHMN. MAYES: Good morning, everyone. It is
2 good to see you. You are sitting too far back, though.
3 I feel we need to fill in the front seats. So I don't
4 know what is going on here. We have a shyness issue.

5 But we are here for the first externalities
6 workshop of the Arizona Corporation Commission, in 2010
7 anyway. It is April 9th. I want to thank everyone for
8 being here. Let me just run through how I thought we
9 would run the meeting today. And then if my colleagues
10 want to make some opening remarks, that would be great.

11 I think this is a very important and hopefully
12 it will be an informative workshop for the Commission.
13 And we are obviously starting with water, but we will
14 plan on expanding our inquiry into other areas of
15 interest, areas of externalities, including emissions.
16 And so I am really looking forward to hearing what
17 everyone has to say today.

18 What I thought we would do is start with
19 presentations from the utilities. APS has a formal
20 presentation that it would like to make. I would like
21 to have any other utilities that are here come to the
22 front table so that we can talk so that they can provide
23 comments after APS does. And then what I thought we
24 would is what we normally do, which is go around to
25 everyone in the audience to provide comments or

1 reactions to the presentations. And the Commissioners
2 will also be reacting to the presentations and asking
3 questions.

4 Then this afternoon, we have Dr. Mike
5 Pasqualetti coming in from Arizona State University
6 coming in to make a presentation on a study that he has
7 done on water as an externality. And that will be also
8 very interesting. And then we will do the same thing,
9 after Mike talks, we will respond, all of us will
10 respond and ask questions and go from there.

11 So why don't we begin. We will have APS. I
12 guess Mr. Dodds is here for APS to make the initial
13 presentation. Lotts, sorry. Get you confused every
14 time. It has been a long week, Bob. Please forgive me.

15 And do we have -- who else from the electric
16 utilities? Okay. Come on forward. We just -- is
17 TEP -- are you from TEP?

18 Well, hello, Mr. Dion. I thought I saw some
19 folks from TEP.

20 COM. NEWMAN: We should bring him in the front.

21 MR. ANDREW: Arizona Electric Power Co-Op.

22 CHMN. MAYES: Oh, you are from AEPCO. Great.

23 Mr. Dion? Okay. Great.

24 COM. NEWMAN: Especially after yesterday's very
25 short presentation from Tucson Electric Power --

1 CHMN. MAYES: Exactly.

2 COM. NEWMAN: -- I thought we should put him up
3 front and center.

4 CHMN. MAYES: Before we get started,
5 Commissioners, would anyone like to make any opening
6 comments?

7 COM. STUMP: I will if Paul does.

8 CHMN. MAYES: Commissioner Newman.

9 COM. NEWMAN: Yes.

10 CHMN. MAYES: Paul? Anyone?

11 COM. NEWMAN: Just briefly. I, too, I thank the
12 Chairman for having this meeting day. I think this is
13 the beginning of a very important discussion on the full
14 monetization of costs that are involved in the
15 ratemaking process. And I think it is squarely within
16 the jurisdiction of the Commission to talk about these
17 variables and especially water.

18 Water in our environment is very important, from
19 a -- clean water, clean air are just two basic values of
20 our society, haven't always been that way but certainly
21 since the 1970s. And there have been a number of
22 studies that I have seen, and I met with a number of
23 people around the country who are really analyzing this
24 externality discussion. I think it is very good that we
25 are doing this now.

1 I expect it to last a fairly long time in terms
2 of we are not rushing into this. There will be
3 evaluations. We are just taking public comment, getting
4 people's thoughts now. But I perceive that at some
5 point in time, if we are able to get funding, that we
6 might be able to do Arizona related externality funding
7 that also we can make comments on. So this is just the
8 beginning of the process.

9 And one other thing, this is a good segue into
10 Bob, Bob speaking, but I was up in Jackson Hole, Wyoming
11 at a forum of mostly legislators and some public utility
12 Commissioners. It was at the invitation of actually the
13 new senatorial candidate from the state of Wyoming who,
14 Alan Simpson, Alan Simpson's son, who actually invited
15 me. And I was surprised because my major presentation
16 was going to be externalities, and I thought that would
17 be a very good discussion with legislators and
18 policymakers from around the west. That's who we were.
19 And I did this whole presentation, was all ready to be
20 lined up, and lo and behold, one of the very special
21 sessions I go to, a two and a half hour session, was a
22 professor from Harvard who is basically suggesting that
23 all public policymakers that are in our situation should
24 be looking at externalities, for that matter legislators
25 should be looking at externalities as well, and all the

1 public utilities.

2 It is probably one of the more important
3 questions that we have, certainly in this age of trying
4 to figure out what is the best mix for Arizona. We need
5 to know about these externalities. We need to try to
6 make good faith attempts to monetize them, to shape them
7 for our particular situation in Arizona. And I think we
8 will be doing everyone a good public service, that's the
9 consumers as well as the companies.

10 And I guess that was Bob's segue, but I just
11 want to add one thing. We added a rule, I -- the
12 Commission added a rule, I forget exactly which month it
13 was, but sort of didn't get a lot of public notice, but
14 we have now a rule on the books in our resource planning
15 context that we will be looking at externalities. And I
16 am very proud to say that I authored that and sort of
17 helped to kick off this discussion.

18 I am also very gratified that Mr. Pierce is
19 here, we are all here, and that it was a unanimous vote
20 to look to externalities. And no matter where you fit
21 in the spectrum of where we are going, I think that we
22 need to discuss this. And I thank Mr. Pierce for
23 engaging in this as well.

24 And with that, I give it to my Harvard graduate,
25 Mr. Stump.

1 COM. STUMP: Paul, first you talk about my
2 Hawaii connections and the fact that I went to high
3 school with Barack Obama. And now you are talking about
4 my affiliation with the Kremlin on the Charles, but...

5 COM. NEWMAN: I am not running against you.

6 COM. STUMP: I thought we had an agreement of
7 sorts.

8 Pleased to be here. And of course this is a
9 topic of great importance as it relates to a variety of
10 issues. And I have a series of questions as it relates
11 particularly to the water-energy nexus.

12 One question, of course, involves the issue of
13 groundwater depletion. Obviously if wells are dug
14 deeper, water has to be lifted higher by pumps. And
15 that requires a lot of energy.

16 The other issue is one that relates to
17 desalination. This increases the supply of quality
18 water but of course consumes large amounts of power and
19 is, I think, a rather compelling issue as it relates to
20 our existence in the desert. And Herb Guenther, for
21 one, made an interesting comment at a water and energy
22 hearing I attended back in 2009. And he said
23 desalination was, quote, the direction for the state to
24 head, as it is the only drought proof and truly
25 sustainable supply of water available, which I think is

1 a fascinating comment indeed.

2 I would be curious to examine, as well, the role
3 for renewable energy in powering desalination efforts as
4 well. I think a certain area in Mexico, whose name
5 escapes me, is working to potentially use a solar array
6 to power a desalination plant. And I think their
7 efforts merit monitoring.

8 The issue of wastewater as well, that's an
9 emerging new technology, I know, involving microbial
10 fuel cells which potentially can clean up wastewater
11 while generating electricity rather than consuming it,
12 again I think an area of great interest as well.

13 And lastly, Arizona of course is home to uranium
14 ore deposits, which will be an increasing demand as
15 everyone pushes toward more noncarbon based energy
16 sources. And there is a two-year timeout on a variety
17 of mining claims down in the Grand Canyon and elsewhere.
18 But I have been curious to examine further some of the
19 methods to protect the springs that feed the Colorado
20 River and protect it from contamination, again an issue
21 that relates to the water-energy nexus quite intimately.

22 So I am looking forward to hearing your thoughts
23 today and pleased to be here as always.

24 CHMN. MAYES: Thank you, Commissioner Stump.
25 Those are all excellent areas of inquiry, and looking

1 forward to hearing what the utilities and all the
2 parties who are here today have to say about it.

3 Commissioner Pierce, did you want to make some
4 comments?

5 COM. PIERCE: Sure. It has been interesting.
6 Being on the Commission for a little over three years,
7 one of the concerns that I have had and mentioned many
8 times along the way is are we getting the true cost,
9 whether it was water or electricity, whatever it is
10 associated with that commodity.

11 When I was in the car business, we, you could
12 have two identical used cars on the outside. And I look
13 at water, I mean you could have pure water, and that's
14 your end product. But to get to that point one may have
15 had a lot of problems to get to that point and another
16 one taken well care of. And inside and out it is that
17 way. And I look at, at the end of the day, one of those
18 really cost a whole lot more once you get all the
19 service tickets in with it, but at the end of the day it
20 was a car that could run.

21 And that's how I look at this, is making sure
22 that all the externalities are in front of us so that
23 we, as decision makers, can really know what is the best
24 deal for ratepayers, what is the best deal for the
25 public, because I think if we don't do that, we are

1 simply, we are simply avoiding reality. And that's -- I
2 think it is important for us to make sure that we pull
3 all those things into place so that the long-term
4 decisions are based on what the real costs are of the
5 commodity that we regulate and so that we can choose
6 options that make sense. And they may not be the
7 conventional one. They may have to be explained to me.
8 But I think when you line it up and say here are the
9 real costs associated with it, now here is the new
10 bottom line, I think that's, that's fair. And that's
11 what people expect of us. It is good to be here.

12 CHMN. MAYES: Thanks, Commissioner Pierce. So
13 let me, in the vein of what Commissioner Stump did, let
14 me throw out some questions as well.

15 And, Mr. Dion, I noticed that you haven't
16 brought your generation experts with you, so it might be
17 a good idea for you to try and get them up here this
18 morning. I don't know if you can make a phone call or
19 two.

20 But, Mr. Hutchens, you know, we are here, we
21 have an entire Commission seated here and we are serious
22 about this issue.

23 And I think your legal expertise is second to
24 none, but you don't run your generating units so...

25 MR. DION: No.

1 CHMN. MAYES: Could we make a phone call?

2 MR. DION: Absolutely.

3 CHMN. MAYES: Great. I would like to know from
4 the parties present today, especially these questions
5 will be particularly pertinent and relevant to the
6 utilities, but I would like to know what the utilities'
7 current water portfolio is; which of their plants use
8 groundwater, to Commissioner Stump's point; which plants
9 use effluent currently; which plants use CAP water; what
10 are the utilities' current plant cooling methods once
11 through; how many cycles for each of those plants; what
12 are the current consumption profiles for the plants
13 under your control per megawatt hour; have you
14 considered pricing water costs internally; what pricing
15 methodology have you utilized if you have priced them
16 internally; have you utilized marginal cost pricing or
17 some other methodology; what are the principal obstacles
18 to implementing hybridized dry cooling at both renewable
19 and conventional power plants, and I think Mr. Lotts is
20 probably going to touch on that; and if the Commission
21 were to price water as an externality, what methodology
22 would we use; what do those present think about the
23 Synapse study which used, I believe, marginal cost
24 pricing, the Synapse study in Utah. And that's it for
25 now. I am sure I will have additional questions.

1 But, Commissioner Newman.

2 COM. NEWMAN: Yeah, I really think that
3 Mr. Pasqualetti for ASU, we are lucky to have him. And
4 I am not going to set out a million questions until
5 Mr. Pasqualetti gives his presentation this afternoon.
6 I am not going to reinvent that and sort of waste time.
7 But many of the issues that he brings up are important
8 to me, so listen closely to that presentation.

9 But I am curious, and this is multidisciplinary
10 sort of questions that we are asking, I am curious about
11 sort of trends in the southwest due to climate change
12 and, you know, really how much the Colorado River water
13 we are going to have, what is the real water status in
14 Arizona. So it is a little bit working with DWR on
15 answering some of these questions. But if we have a
16 decrease in water, if the climate, if the climate keeps
17 on going the way it was but for this year, which
18 happened down in Tucson, it was the wettest year in 60
19 years, but we are in a 100-year drought still, even
20 though the reservoirs are full, but I am just curious,
21 in that whole context of future decision making context,
22 you know, what is the price of water really going to be.
23 And that's, that's a real tough one.

24 But the other, I am very interested in cooling.
25 In just about every line siting case I talk about

1 cooling. And I am still -- there are several states,
2 including Nevada, that actually mandate cooling. And so
3 I realize that it is a little bit extra expense, but I
4 respect my colleagues in Nevada and I want to really dig
5 kind of deep into that a little bit. And that involves
6 the price of water as well as the cost to go to
7 hybridized or dry cooling.

8 And I know we are working on the water nexus
9 today but there are a number the other issues as this
10 dialogue continues I will have questions about. And
11 that's why I said this is a big topic. It almost makes
12 one need to breathe, you know, take a real deep breath,
13 because we are taking on a lot.

14 I met with the Synapse people from Nevada who
15 did the study. What is interesting about that, they
16 were not asked by the commission only to do the study.
17 It was a combination of all the different executive
18 departments and the commission. And still they have not
19 gotten feedback on that. They had a meeting, but I have
20 not even talked to the Utah commissioners yet on their
21 take on that study.

22 But I also think that we should include as
23 partners in this process DWR, DEQ, because they could
24 help us define some of these issues. But I am very,
25 very glad that this many came to this first meeting.

1 And I look forward to the discussion that I think will
2 be lasting for, you know, past December.

3 CHMN. MAYES: Okay. Thank you. Why don't we go
4 ahead and get started, Mr. Lotts.

5 MR. LOTTS: Thank you, Chairman Mayes,
6 Commissioners. Hopefully during this I will answer
7 several of the questions you had, but because I was
8 writing them down I know that there will be more
9 questions and I know you will stop me and ask me
10 questions whenever you need to.

11 For the presentation that I will go through
12 today, I just want to go through how we use water at our
13 power plants; some alternative cooling systems that we
14 in the entire industry have been looking at; utilization
15 of alternative cooling water supplies, effluent being
16 the one we will look at today; protection of our
17 environment; power plant water use, different types of
18 plants; looking forward, where do we go from here.

19 Just really starting with the basic concept of
20 how water is used at the plant, we pump the liquid into
21 a system. It is heated by an external heat source.
22 That is turned into steam, which then, in turn, turns
23 the turbine which turns the generator. And then the
24 steam is recondensed by cooling and returning to a
25 liquid state and starts all over again.

1 So the major purpose of the cooling system is to
2 reject the heat duty from the steam condensation on the
3 atmosphere. There are a couple ways you can do it, and
4 one is a direct cooling system. And this is what is
5 typically referred to as an air cooled condenser, where
6 you reject the steam, the heat, directly to the
7 atmosphere. The other one is through an indirect
8 cooling system where we use the condenser in the middle
9 of this and reject the heat duty through the condenser
10 and then into the atmosphere through cooling towers.

11 This is a typical mechanical draft cooling
12 tower. You see the cooled water is pumped from the
13 basin through the condenser where it picks up the latent
14 heat, returning the hot water then to the cooling tower.
15 It is sprayed over media and the cool air is sucked in
16 from the bottom of the tower and then rejecting the hot
17 air out of the top of the tower.

18 Make-up --

19 CHMN. MAYES: Mr. Lotts, is that, so that's,
20 going back to the last slide, this is for sort of your
21 average conventional combined cycle plant or are we
22 looking at nuclear here?

23 MR. LOTTS: This is typical of a nuclear power
24 plant, combined cycle, coal. You use this kind of tower
25 for any, any kind of plant.

1 CHMN. MAYES: Conventional wet cooling?

2 MR. LOTTS: Yes.

3 CHMN. MAYES: Okay, thank you.

4 MR. LOTTS: Make-up water requirements for a wet
5 cooling tower, all the flows, you have the circulating
6 water that comes into the tower system and the
7 circulating water out. Evaporation of the heat comes
8 off the top of the tower along with the drift. You have
9 a blowdown stream to maintain the chemistry in the circ
10 water system and then you have a make-up water that is
11 coming into the system. Your make-up flow rate then is
12 the combination of evaporation, drift and blowdown.
13 Those are all outflows from the cooling tower. And the
14 makeup is our water that comes in.

15 Looking at different types of cooling systems,
16 you can go anywhere from a total dry system that uses
17 zero percent water to a total wet. Everything in
18 between is classified as a hybrid type of a system. The
19 enhanced dry is like putting a mister system underneath
20 the air cooled condenser to reduce the outside air
21 temperature for the cooling system. And then the plume
22 abated that I have up here, I will talk about that in
23 more detail. It is easier to show you a picture of that
24 one. But I will turn to just the typical wet cooling
25 tower.

1 100 percent wet is by far the lowest cost
2 solution for a plant --

3 COM. NEWMAN: Without externalities.

4 MR. LOTTS: Without externalities, just for
5 building a plant.

6 -- highest net generation, lowest parasitic
7 power consumption. Parasitic loads are all the loads
8 associated with the cooling system, whether it is fan
9 motors, pump motors, anything that takes energy away
10 from the plant. It also has the smallest footprint for
11 the plant and the highest annual water usage of systems.

12 This is a 100 percent dry cooling system. This
13 plant is in South Africa. It is six 100 megawatt
14 coal-fired units. And it is totally dry. The dry
15 cooling system usually performs best in cool, humid
16 climates. Retrofitting existing plants are very
17 difficult in that it requires an increased turbine back
18 pressure. And I won't go too far on that at this time.
19 It is a significantly larger footprint than a wet
20 cooling tower system. It has the highest lifecycle
21 cost, and that is the total cost through the life of the
22 plant; and the highest parasitic load; highest new
23 construction cost; lowest net generation, particularly
24 on hot days. Anything above 100 days you start losing
25 efficiency off the plant. And the advantage, of course,

1 is it is zero percent of the water usage.

2 CHMN. MAYES: Mr. Lotts, if you could, stay on
3 that plant. I spent three months working in South
4 Africa when I was in college. And it is not a humid
5 climate. It is very much like Arizona's climate. So
6 obviously they found a reason to build this plant.

7 Is this a merchant plant or is it owned by the
8 South African government?

9 MR. LOTTS: You know, I don't know the answer to
10 that question, Chairman Mayes. But when I talked to
11 GEA, who was the contractor for this, they said the
12 reason they built it dry was because there was no water.

13 CHMN. MAYES: Where in South Africa was this
14 built, do you know?

15 MR. LOTTS: I don't remember. He told me the
16 name of the area but...

17 CHMN. MAYES: Johannesburg? Okay, I don't want
18 to get that far in the weeds.

19 MR. LOTTS: You could come up with a lot of
20 names and I would just have the same look on my face.

21 CHMN. MAYES: Okay. Do you know how much more
22 costly this was to build than the wet cooled
23 alternative?

24 MR. LOTTS: Between three and five times higher
25 cost to build a dry cooling system.

1 CHMN. MAYES: Three to five times for any plant
2 or coal or --

3 MR. LOTTS: That's typical cost, is three to
4 five times. And --

5 CHMN. MAYES: Go ahead, sorry.

6 MR. LOTTS: The hotter, dryer the climate the
7 bigger the footprint the dry cooling system has to be.
8 So you just start getting more up on the five times more
9 depending on the climate.

10 CHMN. MAYES: Okay. Commissioner Newman.

11 COM. NEWMAN: And I don't want to interrupt that
12 much, but I will try not to, but five times what?
13 Because I have heard it will definitely add cost. Five
14 times of the total cost of the plant?

15 MR. LOTTS: No, five times of the total cost of
16 the cooling system. That's an excellent question,
17 Commissioner Newman. That's what we are looking at, is
18 five. If I build totally wet versus totally dry, it is
19 five times different cost.

20 COM. NEWMAN: Right. And that's one of the
21 things that we need to drill down on, because I have, I
22 have talked to a lot of different people. I actually, I
23 was doing research on this a whole year before I got
24 elected, so I have been researching for awhile. And I
25 know it is a higher cost. But I would like to get, you

1 know, a better number. And I have heard, I have heard
2 diverse opinions about it.

3 MR. LOTTS: Yeah. And that's, you know, one of
4 the things that we are doing right now is to perform a
5 more in-depth study looking at this environment,
6 specifically the State of Arizona and our climate, and
7 what would that cost be in this area. And, you know,
8 that's the kind of information we really need to be able
9 to make good decisions.

10 COM. NEWMAN: And I mentioned it before but
11 Nevada, and actually there was a move in New Mexico and
12 New Mexico legislature to mandate dry cooling as well,
13 both environments very similar to ours. But we have a
14 much better deal on our CAP water because of our legacy
15 of congress people who put us in that position. But
16 that doesn't mean that we shouldn't be counting our,
17 counting the water crops.

18 MR. LOTTS: Yes.

19 COM. NEWMAN: Thank you. Thanks for that
20 clarification.

21 MR. LOTTS: So plume abated tower, it is
22 identical to a wet cooling tower with a dry section on
23 top. The possible water savings -- this plume abated
24 tower was really developed to do exactly what it says,
25 to abate the plume off the top of the tower. And there

1 are a few reasons for it. Some were built at the end of
2 a runway on an airport and so there was a reason for
3 doing that. Other areas that are colder climates, the
4 plume was actually drifting out onto the roadway and
5 causing black ice on roadways. And it was the biggest
6 reason for development of a plume abated tower.

7 The positive effects of that, though, it has a
8 possible water savings of 10 to 15 percent. It has, it
9 does have a significantly higher construction cost. And
10 this one, I can't tell you what that range is because it
11 depends on the plant and how much water you want to save
12 and those kinds of things, it does have a higher
13 parasitic load. And it has a higher lifecycle cost
14 compared to a mechanical draft tower.

15 And then this plant is a plant that is in
16 Colorado. It is Xcel Energy. It is a 750 megawatt
17 coal-fired plant. It is a combination of an air cooled
18 condenser and a wet cooling tower. If you want to
19 achieve a water savings of greater than 15 percent, you
20 have to do something beyond the plume abated tower. The
21 investment cost and lifecycle cost is significantly
22 higher. It has, of course, a larger footprint for the
23 plant. And the water savings is dependent on the size
24 of the dry section. So in this plant, they built an air
25 cool condenser that was sized for the plant, so

1 100 percent dry cooling. And they built the wet side to
2 make up for the losses in the summer. So they built a
3 marginal wet side with a 100 percent dry side.

4 And I don't have the cost of this but we are
5 working with Xcel Energy to find out what the costs were
6 associated with this system.

7 So now we will talk about alternative cooling
8 water supplies and what that requires. And I am going
9 to use Palo Verde as an example, because we use effluent
10 there. And 62 or 61 percent of our water that we use
11 for all of our power plants is effluent.

12 So this is the nuclear power plant. Its
13 external heat source is the reactor.

14 CHMN. MAYES: Could, I am sorry, but could you
15 go back to that slide. Is that the one -- yes. This
16 is, this pie chart shows your total water use for all of
17 your generating units?

18 MR. LOTTS: Yes.

19 CHMN. MAYES: Is this for -- so this is for all
20 the generating units that are owned and operated by APS?

21 MR. LOTTS: By APS.

22 CHMN. MAYES: Not necessarily all the generating
23 units from which you purchase power?

24 MR. LOTTS: That's correct.

25 CHMN. MAYES: And we might get that information

1 from Mr. Pasqualetti this afternoon, a little broader
2 look.

3 So the 61 percent referenced effluent, most of
4 that probably comes from Palo Verde?

5 MR. LOTTS: Most of that is Palo Verde. Redhawk
6 also uses effluent supplied through Palo Verde.

7 CHMN. MAYES: So Palo Verde and Redhawk are the
8 two units that use --

9 MR. LOTTS: That's correct.

10 CHMN. MAYES: -- effluent?

11 MR. LOTTS: Okay?

12 CHMN. MAYES: Uh-huh.

13 MR. LOTTS: The surface water that you asked
14 about, Four Corners uses surface water. The Sundance
15 plant uses CAP water, surface water.

16 CHMN. MAYES: So Four Corners is CAP water?

17 MR. LOTTS: No. Four Corners is --

18 CHMN. MAYES: It is river water.

19 MR. LOTTS: River water.

20 CHMN. MAYES: Colorado River water. Little
21 Colorado?

22 MR. LOTTS: It is off the San Juan.

23 CHMN. MAYES: Off the San Juan, Four Corners,
24 right.

25 MR. LOTTS: Yes, up in New Mexico. Then the

1 Sundance plant is CAP water. And our Yucca plant down
2 in Yuma is also considered surface water, although --

3 COM. PIERCE: It is that allocation.

4 MR. LOTTS: It is that allocation.

5 CHMN. MAYES: Okay.

6 MR. LOTTS: So --

7 CHMN. MAYES: And which plants are on
8 groundwater?

9 MR. LOTTS: That is our west Phoenix plant, our
10 Ocotillo plant, and our Saguaro plant, and our Cholla
11 plant. There is some groundwater used at Palo Verde.
12 We have about 5200 acre feet of groundwater rights at
13 Palo Verde. We use groundwater for our potable water
14 system because we are pretty remote. We have our own
15 licensed water treatment plant operators out there. And
16 we also use it for make-up to the primary, secondary
17 cooling systems.

18 CHMN. MAYES: So of the groundwater plant, the
19 plants that use groundwater, west Phoenix, Ocotillo, and
20 Saguaro would be gas plants.

21 MR. LOTTS: Those are gas plants, and then
22 Cholla is coal plant.

23 CHMN. MAYES: Coal plant. Okay.

24 This might be the time for this question. Has
25 APS done a contingency analysis of their plant

1 operations under extreme drought conditions? I think
2 Commissioner Stump sort of touched on this issue. Have
3 you done an analysis of which plants might have to be
4 backed down or would be threatened under extreme drought
5 conditions?

6 MR. LOTTS: The ones that would be subject to
7 that right now are Sundance plant, it is on excess CAP
8 water, and our Yucca plant that has fifth and sixth
9 priority rights off the river. So those are the two
10 plants that I am looking at right now to have a
11 different supply available for those plants in case of
12 that contingency.

13 CHMN. MAYES: So you are analyzing that issue?

14 MR. LOTTS: Yes. That's my job.

15 CHMN. MAYES: Okay. That's very interesting.
16 And then the other ones that are on groundwater, though,
17 are you looking at what might happen if the wells that
18 you have for those plants become dewatered as a result
19 of extreme drought?

20 MR. LOTTS: Yeah. That is the next priority for
21 us to take a look at, is on our groundwater supply. We
22 also want to set up monitoring for our surface water,
23 all of our surface water supplies for the Four Corners
24 plants. So we have real-time knowledge of what the snow
25 pack is up in that area of the country and we will know

1 if we need to exercise any of our other contracts so
2 that we have a secure supply of water to support those
3 plants.

4 CHMN. MAYES: Okay. Commissioner Newman.

5 COM. NEWMAN: I will make it quick and dirty. I
6 would like to see this graph annotated in terms of the
7 questions that the Chair just brought up. It would be
8 helpful.

9 And I was going to ask you about effluent and --
10 you know, on top of it. So I have a request to have an
11 annotated graph because I think this is important. And
12 I would like to see such a graph for all the operators.
13 It would be helpful, certainly would.

14 MR. LOTTS: Yes, that's --

15 COM. NEWMAN: And on effluent, I recently read
16 the article, in fact, I think Mr. Schultz may be quoted
17 in it, but the new contract that you negotiated, I am
18 not sure who negotiated it, but your company negotiated
19 with the municipalities. And I had always wondered
20 about the price of that water.

21 And would it be accurate to say that the
22 original effluent contracts with the municipalities
23 were -- I will say it -- was it close to a sweetheart
24 deal or was it a good deal for the cities and good deal
25 for you?

1 MR. LOTTS: Well, you know, in 1973 when,
2 Commissioner Newman, in 1973 when the cities and the
3 Palo Verde participants entered into that agreement, it
4 was a very different time. And getting rid of
5 wastewater was more of a nuisance than anything else.
6 And we had no value. Reuse wasn't -- we didn't do
7 anything with reuse water at that time. So in the
8 cities' mind at that time, to get anything out of that
9 water was a good deal. And so some people looked at
10 Arizona nuclear power plant participants at that time
11 and said why would you pay anything for water.

12 You know, times changed and things moved on and
13 it became more of a resource and had more value
14 associated with it. And we both, actually all 12
15 parties, seven Palo Verde participants and five cities,
16 thought that now was a good time for us to come up with
17 a new agreement.

18 COM. NEWMAN: And one of the reasons I am asking
19 questions about that chapter, if you would, it gives
20 some insight into market rates for effluent, I suppose,
21 that are more accurate in this year as opposed to the
22 1970s. But any comments about that?

23 MR. LOTTS: Commissioner Newman, I -- you know,
24 it is difficult, it was difficult for us to come up with
25 a true market value of effluent. And it varied

1 depending on the complexity and level of treatment from
2 wastewater treatment plants, the location of them. All
3 those kinds of things really vary the cost of the
4 effluent from the waste water treatment plants depending
5 on where it was.

6 We thought we all came up with a, the cities and
7 Palo Verde came up with what we thought was a fair
8 market price for the water in this contract.

9 COM. NEWMAN: It is a huge amount of water. The
10 article stated how much water it was, but, and that's
11 what we are here for to determine as well. That's
12 probably your next slide.

13 MR. LOTTS: Okay.

14 COM. NEWMAN: So I will be quiet now, but just
15 an annotation for all the companies would be helpful.
16 And if it is covered in further charts, I will stop
17 right now.

18 MR. LOTTS: Okay. So at Palo Verde or any
19 nuclear plant that uses this kind of system, the
20 external heat source is the reactor. It heats the water
21 that's circulated through the steam generator. The
22 steam then turns the turbine which turns the generator
23 back to the condenser. And then the cooling system is
24 used to recondense that steam back to water.

25 At the Palo Verde plant, we use effluent, like I

1 said. To utilize the effluent and to achieve the
2 management plan goals of 15 cycles of concentrations a
3 water treatment facility had to be built. That water
4 treatment facility, you see the line coming -- I will go
5 into more detail on that plant and its design -- treats
6 the water. Then the treated water is sent out to the
7 two reservoirs. And those reservoirs hold approximately
8 a billion gallons of water. That water is then pumped
9 into the cooling system, the cooling towers here. The
10 cooling towers feed the turbine building. So this flow
11 from the cooling towers into the turbine building is
12 typically around 500,000 gallons a minute. The make-up
13 flow, you know, averages about 45,000 gallons a minute
14 during the course of the year.

15 When the chemistry needs to be adjusted, which
16 we do on a continuous basis at Palo Verde, we blow the
17 water down to the evaporation pumps and then it
18 evaporates off into the atmosphere.

19 Because typically power plants and wastewater
20 treatment plants aren't collocated, a conveyance system
21 is built. This one to Palo Verde is a little over
22 36 miles long. It is gravity from the 91st Avenue plant
23 to the pump station, which is located on the Hassayampa
24 River. And then the last eight miles is uphill about
25 150 feet into the plant.

1 COM. NEWMAN: Madam Chair.

2 CHMN. MAYES: Commissioner Newman.

3 COM. NEWMAN: Real quick. I think it is a good
4 enough time. It is a good time to ask this question as
5 well. I am going to be briefed in the first week of May
6 a little bit more on your nuclear operations and perhaps
7 future plans, but I am going to ask a question now. So
8 might as well be ready for it in May and ask it of you.

9 When I read the article about the purchase of
10 the water at a higher price, what went into my head was
11 what if. And I think what if -- strike that. But what
12 if we, APS and SRP and other players came up with a
13 proposal to expand? And what, is there enough water to
14 cool more towers -- more units? I mean this is sort of
15 a nuclear engineering question and I am just curious
16 about it. You understand why I am asking?

17 MR. LOTTS: Commissioner Newman, the supply we
18 negotiate is for Palo Verde. And it meets the needs of
19 the Palo Verde plant.

20 COM. NEWMAN: Present at Palo Verde.

21 MR. LOTTS: As it exists today.

22 COM. NEWMAN: Okay. And so in the spirit of
23 future resource planning and trying to monetize things,
24 you would have to find an alternative water source or ag
25 water or native American water or how?

1 MR. LOTTS: For any new base load generation we
2 would put in place that uses water, we would have to
3 find a new source of water.

4 COM. NEWMAN: And what are the company's plans?

5 MR. LOTTS: For finding new sources of water?

6 COM. NEWMAN: Yes.

7 MR. LOTTS: You know, we are always looking at
8 water sources that are available but typically don't
9 make a purchase unless you know what it is you need. I
10 don't know a better way to say that. I mean if you
11 needed -- we just need the margin to keep up with our
12 current generation right now.

13 COM. NEWMAN: Because I am a novice, well, a
14 novice in sort of purchasing water for power, the -- oh,
15 it happens.

16 MR. LOTTS: I have broken it.

17 COM. NEWMAN: The other water sources would be?

18 MR. LOTTS: You know, there is multiple
19 different water sources that are available from some
20 groundwater which is brackish groundwater. There is, as
21 we continue to build in the state, there is more
22 effluent that becomes available. There is the ADD water
23 process that CAP has gone through which talks about new
24 water supply coming into the state.

25 There is not much surface water but the majority

1 of the water in the State of Arizona has been spoken for
2 and utilized by all of its -- everybody who needs water
3 currently. So it is a very complex issue to go out and
4 acquire new water.

5 CHMN. MAYES: To this point, Commissioner
6 Newman.

7 COM. NEWMAN: Please.

8 CHMN. MAYES: And then we probably need to
9 finish and continue on and finish up.

10 But would it be fair to say, Mr. Lotts, that
11 APS, and I will ask this of the other utilities, when it
12 is seeking out new sources of water, will not be seeking
13 out groundwater as a new source of water? Are you
14 considering groundwater as a new source of water for a
15 new power plant?

16 MR. LOTTS: Well, I mean I am not really looking
17 at a new supply for a new power plant. But we are
18 looking, we look at all the alternative water supplies,
19 and not only from cost but mining groundwater and
20 political atmosphere of things and what is the right
21 thing to do. So I don't want to say we are not
22 considering groundwater because, you know, you always
23 have to look at the entire water portfolio and what that
24 looks like, but we also live in this state and we want
25 to do the right thing also.

1 CHMN. MAYES: Right. And from my standpoint as
2 a regulator, I frankly, you know, if we had a combined
3 cycle plant come in front of us again, one of the
4 questions I would ask would be I would like to see DWR's
5 100-year ground water supply reports, because I am
6 increasingly concerned that the GRD system that we
7 currently operate under really has way too many
8 loopholes in it. And, you know, we could end up siting
9 power plants in parts of the Phoenix AMA that are going
10 to become dewatered because of this GRD system that
11 allows you to withdraw water in one area and replace it
12 all the way across the AMA. And it is, it is a disaster
13 waiting to happen, I think. So I think this Commission
14 and future commissions are going to have to take a very
15 close look at where these power plants are in place.

16 MR. LOTTS: Chairman Mayes, I would say that
17 would be a good challenge for anybody who comes before
18 this Commission.

19 CHMN. MAYES: Okay. Thanks.

20 COM. NEWMAN: Thank you, Madam Chair. I think
21 that's, that's the kind of information that is
22 fantastic. I am glad you are talking about it.

23 MR. LOTTS: So the treatment facility is a
24 90 million gallon a day water treatment plant. It is
25 called a tertiary treatment facility, where you take the

1 effluent, secondarily treated effluent from the SROG
2 cities. So it is the Sub Regional Operating Group,
3 which consists of Phoenix, Scottsdale, Tempe, Mesa, and
4 Glendale. And we also have a supply of effluent that
5 comes from the City of Tolleson. This facility is
6 designed to reduce ammonia, reduce hardness and polish
7 the water before it is sent out to the reservoirs.

8 The water use at Palo Verde in 2009 was 738
9 gallons a megawatt hour. The total water use for Palo
10 Verde during 2009 was 69,405 acre feet, or about 22.6
11 billion gallons of water. Our cycles of concentration
12 are greater than 25. We have a performance metrics on
13 the plant that says this is our baseline on what we
14 think we can achieve or what we should be able to
15 achieve at the plant. That equates to a total dissolved
16 solids parts per million in the circulating water system
17 between 25,000 and 29,000. And we don't exceed that
18 because we have an air quality limitation of 30,000 ppm
19 of TDS per month. So we have to maintain our
20 concentration below that.

21 COM. NEWMAN: Madam Chair.

22 CHMN. MAYES: Yes, Commissioner Newman.

23 COM. NEWMAN: I just want to for the record get
24 an explanation. Any hydrologists in the room? But you
25 are the closest one and I will ask.

1 70,000 acre feet is a lot of water, I know. But
2 I always like to try to analogize how much that is. You
3 know, compared to all the other uses of water, when you
4 see it in black and white, it looks like, even though it
5 says 22.6 billion gallons, you still -- you know, that
6 sounds like a lot. It is hard to put it in, put a
7 volume in the context of this room or how big it is.

8 When I worked in Cochise County and we had a
9 100-year flood and the county hydrologist said, you
10 know, at the rate that this was going, it was sort of
11 like the water down the wash, it was almost like a
12 missile going so fast that, you know, you can be like
13 five miles away in like two seconds. You understand?

14 I mean, is there a way that you can tell us what
15 22.7 billion gallons really is?

16 MR. LOTTS: One of the things, Chairman, or
17 Commissioner Newman, that we tried to put it into
18 context, because this is a big number how do you wrap
19 your head around how many gallons that is, I think our
20 calculation was it would fill up Bank One Ballpark
21 1600 times.

22 COM. NEWMAN: That's the kind of thing I was
23 looking at. That's amazing.

24 MR. LOTTS: That's from the plant, or maximum
25 flow rate through this plant would fill a typical

1 swimming pool in about 15 seconds. But the other aspect
2 of that, and we will get to later, is the total state's
3 water budget and put it into that context as well. But,
4 yes, it is a --

5 COM. NEWMAN: Just a final statement. How many
6 Bank One Ballparks?

7 MR. LOTTS: It was about 1600.

8 COM. NEWMAN: Thank you.

9 MR. LOTTS: You are welcome.

10 The blowdown stream that I mentioned earlier is
11 the waste stream that goes out to the evaporation pond.
12 So about 3,000 acre feet per year or about 5 percent of
13 that total make-up water is sent to the evaporation
14 ponds.

15 We have three evaporation ponds. Their nominal
16 size is 250, 220 and 180 surface acres. And they are
17 nominally 30 foot working depth. Evaporation rate in
18 this state is, or in this climate, is 60 to 72 inches
19 per year. So when all three evaporation ponds are in
20 service, that equates to between 3250 to 3900 acre feet
21 per year evaporation. So you will see that we have some
22 redundancy on all of our impoundments now.

23 And pond number 3 is actually under construction
24 when this photograph was taken. That has been
25 completed. Pond number 2 is currently being

1 rehabilitated or relined. The liners are 60 mil HDP,
2 high density polyethylene, liners and they last about
3 20 years. So every 20 years you reline the
4 impoundments.

5 So using an alternative water supply does come
6 at a cost. And our production costs or the piece of our
7 production cost that is seen at the Palo Verde facility
8 at the water reclamation plant is a total of 1.19 per
9 megawatt hour. And the chart breaks down all the cost
10 elements that we have from raw water cost to manpower
11 and chemicals for treatment, are the three main costs
12 that we have at that plant. So --

13 CHMN. MAYES: Commissioner Newman.

14 COM. NEWMAN: Yes. So the 34 percent effluent
15 costs, that was done before the renegotiation?

16 MR. LOTTS: No. This is what the cost will be
17 with the renegotiated price.

18 COM. NEWMAN: With the renegotiation?

19 MR. LOTTS: Yes, that's correct.

20 COM. NEWMAN: And what was it before, may I ask?

21 MR. LOTTS: It was about 10 percent of the cost
22 of operating a plant before.

23 COM. NEWMAN: So now I can ask the question that
24 I wanted to ask since I read the article in the
25 newspaper. How are we to treat this in the rate base

1 without a new rate case? I mean, will this cost come to
2 us in the new rate case down the road, or are you going
3 to eat it?

4 MR. LOTTS: Mr. Edington is looking at
5 efficiencies in the plant --

6 CHMN. MAYES: Hang on guys. For the court
7 reporter, we can't be talking over each other. We had
8 troubles with this yesterday.

9 COM. NEWMAN: Okay.

10 MR. LOTTS: Mr. Edington is looking at
11 increasing the efficiency of the plant to try to absorb
12 this cost into the normal operating expenses of the
13 plant right now. That is his -- what he has said.

14 COM. NEWMAN: And then the final question that I
15 would have asked if Marty were with me when I was
16 reading the article was how much more money now do you
17 spend for effluent than before? Again it was an article
18 but...

19 MR. LOTTS: Annually? I mean it escalates over
20 time. So it is about a little over double, two and a
21 half times where we currently are, and will continue to
22 escalate. The previous contract had a \$30 cap on it and
23 it wouldn't escalate above that. And this one will
24 continue to go up.

25 COM. NEWMAN: And I take it from your answer

1 that you will be seeking some amendment to the rates in
2 the future based on that analysis, or you are going to,
3 not eat it or drink it per se, but try to limit that
4 number in the interest of consumers' pocketbooks?

5 MR. LOTTS: You know, I don't know the answer to
6 that question, Commissioner Newman.

7 COM. NEWMAN: Well, I will certainly try to
8 limit that number in the interest of consumers' pockets.
9 Thank you.

10 MR. LOTTS: In 2005, a new storage reservoir was
11 built. And this reservoir was built because the liner
12 life and the 80 acre storage reservoir had come to the
13 end of its useful life. And since only one reservoir
14 was constructed with the plant, a redundant reservoir
15 was constructed at this time. The design on this
16 reservoir was really the state of the art design, too.
17 Although, the water in our storage reservoir is clean,
18 we wanted to continue to protect the environment.

19 So this reservoir has 10 to 12 inches of soil
20 cement on the side slopes. It is dual lined with a
21 collection system leak detection system. And it returns
22 any water that leaks through the liners and back to the
23 reservoir.

24 The evaporation ponds, the new designed
25 evaporation ponds are very similar to this except there

1 is an additional liner that is under the two high
2 density polyethylene liners, geosynthetic clay liner,
3 and it just adds one more layer of protection.

4 The quality assurance program that we use during
5 the construction process is spark testing to identify
6 any flaws in the liner as it was put down. We also did
7 destructive testing to insure that the tensile strength
8 and elasticity of the material was what our
9 specifications -- met our specifications.

10 We do pressure testing and vacuum testing on
11 each one of the seams. These sheets of liner are
12 34 feet wide. So with a very large 90 acre surface
13 area, there are multiple seams, and you don't want any
14 leaks once you start putting water into these
15 impoundments.

16 Our groundwater monitoring program that exists
17 at Palo Verde is extensive. But our other plants are
18 very similar to this. We monitor the shallow aquifer
19 that exists at Palo Verde as well as the regional
20 aquifer and everything in between. We want to make sure
21 that we don't do anything that would contaminate our
22 drinking water supply in the state.

23 Now we will talk a little bit about typical
24 energy consumption. And this slide was put together by
25 Water Environment Federation. And it goes from raw

1 materials all the way to transmission and distribution,
2 thermal electric fuels, from coal, five to 70 gallons a
3 minute. And it is, as you see, oil and natural gas
4 varied so much that they didn't even put a range on this
5 one. And uranium was 45 to 100 gallons per megawatt
6 hour. And then the other ones don't have the raw
7 material cost. Thermal electric generation, they have
8 their range from 190 to 720 gallons per megawatt hour;
9 although, we know our nuclear plant in the desert
10 southwest exceeds that by a little bit.

11 Evaporative loss often of hydroelectric, they
12 have it as 4500 gallons per megawatt hour, but of course
13 that varies with climate and size of impoundment.
14 Geothermal is 1400 gallons a megawatt. Concentrating
15 solar, we have 750 to 820. And I have seen numerous
16 reports on what those plants will use. And since we
17 don't have one in this area yet, we don't know how
18 accurate those numbers are. Photovoltaic and wind are
19 both minimal water users.

20 This --

21 COM. NEWMAN: Madam Chair.

22 CHMN. MAYES: Yes, Commissioner Newman.

23 COM. NEWMAN: Thank you.

24 Would you mind going back to groundwater
25 monitoring on page 22. I was listening to you, and I

1 basically got that you do extensive monitoring at wells.
2 And I started looking at the legend and something called
3 piezometer.

4 MR. LOTTS: Piezometer.

5 COM. NEWMAN: A piezometer. And whenever I
6 don't know a word, I feel like asking. And I don't know
7 how many people in the room know the word, but that is a
8 piezometer?

9 MR. LOTTS: Commissioner Newman, that is for a
10 shallow well, to give an early indication of any kind of
11 water migrating into that area. And so you would then
12 look for where the water is coming from, what is the
13 source of the water, is it coming from one of the
14 impoundments or is it rainwater flow that's migrated
15 into that well. So it is an early indicator.

16 COM. NEWMAN: And do you work with the Nuclear
17 Regulatory Commission on this or is it with the state
18 DEQ authority?

19 MR. LOTTS: DEQ is our regulatory agent. We
20 work with them very closely in coming up with our
21 aquifer protection permit and our groundwater monitoring
22 plans.

23 COM. NEWMAN: And do they -- how many inspectors
24 do they have working with you, or do they take your word
25 for it?

1 MR. LOTTS: No, they don't, believe me.
2 Commissioner Newman, believe me, they don't take our
3 word for it, and they shouldn't. They come out. And we
4 send in reports and they come out and monitor the plant
5 and look at what we are doing, and challenge us as well.

6 COM. NEWMAN: So, and it is not -- it is DEQ, it
7 is not EPA. But they have a plethora of EPA rules that
8 are enforced by DEQ.

9 MR. LOTTS: That's correct.

10 COM. NEWMAN: Have there ever been any leaks
11 into the groundwater?

12 MR. LOTTS: Any -- we did have -- into the
13 groundwater?

14 COM. NEWMAN: I am asking because I am --

15 CHMN. MAYES: We kind of need to stay on focus.

16 COM. NEWMAN: No, no. I am asking because this
17 is a cost of water, too, I mean monitoring the
18 groundwater, how much does it cost to do that.

19 Have there been some problems? Have you had to
20 do remedies that might cost more, that kind of thing?
21 People don't realize --

22 MR. LOTTS: We did --

23 COM. NEWMAN: -- especially when you are dealing
24 with this kind of water.

25 MR. LOTTS: Commissioner Newman, we did have a

1 tritium that was identified around one of the units.
2 Actually we did extensive testing around the units. We
3 were able to find the source and contain it and mitigate
4 any impact, but it did not get to the groundwater. So
5 that's, that's our plan, is to do early monitoring in
6 our plant and extensive wells so that there is no impact
7 to the groundwater.

8 COM. NEWMAN: And, okay. Well, I will leave it
9 there, but I had to ask a couple more questions.
10 Thanks.

11 MR. LOTTS: Again our water usage, and we will
12 annotate this graph and get that to you. Our power
13 plants' water usage of course in 2009, like I said
14 earlier, Palo Verde was 738. Our coal plants' average
15 was 548 gallons of megawatt hour. Our gas plants were
16 382.

17 CHMN. MAYES: Mr. Lotts, you don't obviously yet
18 have any CSP plants, but could you give the Commission a
19 sense where CSP comes in? It is, what, in the 700
20 gallons range, maybe even 800?

21 MR. LOTTS: Chairman Mayes, I have heard
22 anywhere from, anywhere from 700 to a thousand. So I
23 don't have a better number than that at this time.

24 CHMN. MAYES: Okay. Does APS have -- you do
25 have an analysis of what Solana will use?

1 MR. LOTTS: And that number was somewhere around
2 8- to 900 gallons per megawatt hour.

3 CHMN. MAYES: Okay.

4 MR. LOTTS: Once it gets, once it gets built, we
5 will know exactly what it is.

6 CHMN. MAYES: Okay. Thank you.

7 MR. LOTTS: This is 2008. That's why there is a
8 different number for nuclear, it is not a different
9 plant, 759 gallons a megawatt hour in 2008. This is a
10 combination of APS, SRP and TEP plants. So we looked at
11 all of them to see what is the average for our water use
12 for our plants as a state. And they are relatively
13 similar to what we saw just in the APS plant, 577 in
14 coal and 325 in our gas plants.

15 And this is a pie chart from Department of Water
16 Resources on the total state water budget. And so you
17 see, of the 6.1 million acre feet total of the state,
18 that 400,000 acre feet is used for industrial. And then
19 if you break that industrial down further, you see that
20 the total power plant water use, and this is APS, SRP
21 and TEP again, is about 180,000 acre feet of the total
22 6.1 million acre feet that we use in this state.

23 COM. NEWMAN: So, Madam Chair, just a brief
24 question.

25 The huge budget for, the huge budget for ag

1 business is, I have seen this chart before, but it
2 really is an exclamation on what they are holding.
3 These are reserves of agriculture work or active
4 agriculture work or just designated agriculture use?

5 MR. LOTTS: Commissioner Newman, I believe this
6 is what is reported used to our Department of Water
7 Resources.

8 COM. NEWMAN: Used.

9 MR. LOTTS: I believe.

10 COM. NEWMAN: Used. That's what I wanted to
11 clarify, ag business now. Thank you.

12 MR. LOTTS: So our total usage for generation is
13 3 percent of the total state's water budget. And this,
14 like I said, this is 2006 Arizona state water budget and
15 2008 power plant water usage.

16 So to kind of summarize it and looking forward,
17 of course, I think we all understand that water and
18 energy are interrelated. Conserving one conserves the
19 other. Promoting water and energy conservation is
20 something that needs to happen in our state and,
21 actually, across the United States. Identify
22 alternative cooling strategies, looking at what is the
23 practical application in our desert environment, is it a
24 combination of wet, dry, hybrid kind of plants and
25 towers. And that's what we need to be looking at,

1 identifying alternative cooling water resources and
2 using the right water for the right use; looking at
3 utilizing impaired water, whether that is brackish
4 groundwater or effluent or some other source of water
5 that would need extensive treatment to make use as
6 potable water and conserving that higher quality water
7 for the potable water supplies in the state. And then,
8 lastly, you know, in the future we will require all of
9 the stakeholders to work together to balance the
10 environmental concerns with the total cost impacts to
11 our area.

12 CHMN. MAYES: Thank you, Mr. Lotts, appreciate
13 the presentation.

14 I wanted to ask you a couple questions. And
15 these questions will be also for anyone present today
16 when we go to the comment period.

17 Given the fact that APS has estimated that the
18 state's growth and APS' load could double over the next
19 20 years or so, I think the figure that you have thrown
20 out in the past is 16,000 megawatts to 32,000 megawatts,
21 well, that's for the state I guess, but you certainly
22 are projecting significant growth into the future,
23 doesn't dry cooling or renewable energy almost have to
24 be -- renewable energy, particularly those forms that
25 don't use water -- have to be a part of the answer as

1 well as energy efficiency? And have you -- well, let me
2 ask that first question. Then I will have a follow-up.

3 MR. LOTTS: I want to look at what we are in the
4 process of looking at, Chairman Mayes, is what is the
5 best cooling alternative that gives us the most, the
6 best -- makes the best economic sense. If you go with
7 total dry cooling, it may be the right fit for some
8 applications. It may not be the right fit for every
9 application. And so that's why currently we have a
10 study in progress to look at what makes the most sense
11 in the State of Arizona and whether that's totally dry
12 or a combination of wet and dry.

13 CHMN. MAYES: Okay. Mr. Guldner is going to
14 join you because these might be more policy oriented
15 questions. But I had a second, follow-up question.

16 APS' resource plan states that the company
17 intends to move toward non-wet cooled technologies.
18 There is a bullet point in your resource plan on that.
19 There is nothing more specific than that. What is the
20 time frame for that assumption, Mr. Guldner or
21 Mr. Lotts?

22 MR. GULDNER: Chairman Mayes, Commissioners,
23 Jeff Guldner from APS. And if -- do you want me to go
24 back?

25 CHMN. MAYES: Sure.

1 MR. GULDNER: Let me go back to the first
2 question because I think, as you know, we have got
3 different areas of specialization within the company.
4 And Mr. Lotts is, I know, passionate about the water
5 side of it, but obviously it rolls up into a much
6 broader resource planning picture.

7 And I think, I think your comments were right on
8 the mark, that as you look at the mix you can look
9 within that water component at how do we get more
10 efficient at using water, what are the right mixes for
11 the technologies. But then you can step beyond that
12 into the broader picture and say what role now does
13 energy efficiency play in reducing the need for
14 consumption, what role do nonwater-using renewable
15 technologies like photovoltaic, solar, wind, how do
16 those now fit into that equation. And then to the
17 extent, as you know, we have got base load resource need
18 in the future, the need to put some additional base load
19 resource in, that's when you start getting into the
20 question now with that "do you add the water" piece of
21 the equation.

22 Just something that is happening now at the
23 federal level, this question, how do we integrate more
24 variable energy resources like wind and solar, and what
25 is that causing to systems, generally you need to put

1 some peaking capacity, some gas turbines or some
2 combined cycle combustion turbines or combined cycle
3 components to regulate the system because the renewable
4 resources create more variable impacts on the system.
5 So there is a water component to that right now unless
6 it is totally dry cooling. They all have to tie
7 together in the analysis.

8 We have got -- Jim Wilde is in the audience. I
9 know he is our resource planning director. He can
10 probably give you more specific answers of when we see
11 different things in the actual resource plan. But I
12 certainly agree with the broad policy perspective, which
13 is this is a piece of it, the water component, and
14 within the water component is a piece of it, but there
15 are a lot more things that we have to consider as well.

16 CHMN. MAYES: Okay. Thank you, Mr. Guldner.
17 Mr. Wilde.

18 MR. WILDE: Good morning. Jim Wilde, APS.

19 Chairman Mayes, Commissioners, we are in the
20 process right now of reevaluating our resource plan
21 going forward. So in the resource planning process, we
22 will go into more detail into these discussions, but for
23 right now, we don't anticipate the need for, say, a new
24 combined cycle unit for sometime into the future. And
25 if we did, the assumption that we are using in our

1 planning is dry cooling.

2 So I am hoping that gets to the question of what
3 you were wanting to. And we will go into more detail as
4 we evaluate the plan.

5 CHMN. MAYES: So as you -- Mr. Wilde, do you
6 know -- you don't know yet at what year you hit the need
7 for a new combined cycle plant or a --

8 MR. WILDE: Right now it looks like combined
9 cycle would probably be outside of that 15-year planning
10 horizon, so it is sometime into the future.

11 CHMN. MAYES: Okay.

12 MR. WILDE: And base load, we have, it looks
13 like, a base load need sometime in the mid 2020s kind of
14 time frame, '24, '25, in that time frame.

15 CHMN. MAYES: Base load is '24?

16 MR. WILDE: '24, '25 time frame.

17 CHMN. MAYES: 2024, 2025?

18 MR. WILDE: Correct.

19 CHMN. MAYES: Okay. And, but for base load, the
20 planning horizon for that would start much, much sooner
21 than that obviously?

22 MR. WILDE: Would start much sooner than that,
23 that's correct.

24 CHMN. MAYES: Okay. And for base load, are you
25 making the same dry cooling or hybridized dry cooling

1 assumptions?

2 MR. WILDE: I think Mr. Lotts would probably be
3 better to answer that specific question in terms of the
4 technologies.

5 CHMN. MAYES: Okay.

6 MR. LOTTS: That's the technologies study that I
7 have in process right now, is to look at what are the
8 best alternatives we can use that give us the most
9 efficient operation and looking at the economies based
10 on that.

11 COM. NEWMAN: Madam Chair, just to that point.

12 Are you using outside experts or are you doing
13 this in-house?

14 MR. WILDE: We are using outside experts to help
15 us with this.

16 CHMN. MAYES: So I would assume -- thank you,
17 Mr. Wilde, appreciate that.

18 MR. WILDE: Thank you.

19 CHMN. MAYES: That was good insight. You were
20 using, you are doing a study to assess dry cooling on
21 base, future base load plants?

22 MR. LOTTS: Yes, future base load, different
23 kinds of plants, whether it is any kind of plant.

24 CHMN. MAYES: Which would include nuclear?

25 MR. LOTTS: Just any kind of plant.

1 CHMN. MAYES: Okay. Mr. Guldner, which would
2 include nuclear, right?

3 MR. GULDNER: I think it would. I think it
4 would. That's one of the things, I don't think there
5 has been a dry cooled from a technology standpoint.

6 CHMN. MAYES: Hybridized dry cooling?

7 MR. GULDNER: I am not sure there has been one
8 of those. I think it is a licensing issue in the U.S.
9 as to how you go about doing that. But actually, if I
10 could, Chairman, I wanted to come back maybe to a
11 question that Commissioner Newman mentioned earlier,
12 which was the rate, how does this fit in the rate
13 impacts. And maybe just to try to clarify, the Palo
14 Verde water contract is a good example.

15 As we build our cost of service case together,
16 we put in all the different costs. So, for example,
17 lime is required at power plants to do pollution
18 control. Water is required at power plants to do
19 cooling. And so those all come in as expense.

20 And so what typically happens then is the
21 Commission Staff and the consultants and the parties
22 look at whether our decisions were prudent and then
23 whether those should be included in the either rate base
24 for capital assets or expense from an O&M standpoint.
25 And then that's how it is picked up in rate case.

1 So to the extent a component increases in the
2 next rate case, that will come through in the cost of
3 service study and, you know, people would come in and
4 perhaps say was this a prudent decision or not. And I
5 think what Mr. Lotts said internally what the company
6 may be trying to do and what Mr. Edington is trying to
7 do, how can I offset some of that higher cost by lower
8 expenses, the expense is still going to show up so you
9 may have lower expense here, higher expense on the water
10 side, and try to offset those.

11 But just to be clear, when that study comes out
12 and you see those expenses, they are still going to be
13 in the cost of service study.

14 COM. NEWMAN: Well, and just in response to you,
15 I was a bit tongue in cheek saying I am going to take a
16 close look at that, but I understand that qualification.

17 CHMN. MAYES: So, Mr. Guldner, while we still
18 have you, and then I have got somebody from TEP on the
19 line for my colleagues to ask questions of, but have you
20 considered pricing water costs internally? And if so,
21 what pricing methodologies have you used, and have you
22 considered marginal cost pricing?

23 MR. GULDNER: I am waving for Mr. Wilde to come
24 up because, yes, I know we do consider water. That's
25 part of when we do the revenue requirement analysis for

1 different resources, both the technology such as dry
2 cooling, what additional cost does that have, but just
3 the cost of the water piece of that.

4 CHMN. MAYES: Okay.

5 MR. WILDE: Chairman Mayes, Commissioners, water
6 is included in all of the studies that we do. And we
7 get the costs from Mr. Lotts. And that's all
8 incorporated into what we do.

9 CHMN. MAYES: Well, but how do you price it? I
10 mean, do you do marginal cost pricing or do you do just
11 what the price is, what the first unit cost is?

12 MR. WILDE: We use the contracts we have
13 available.

14 CHMN. MAYES: Which would be different than
15 marginal cost pricing --

16 MR. LOTTS: Yes.

17 CHMN. MAYES: -- which was done in the Synapse
18 study.

19 MR. WILDE: Yes.

20 CHMN. MAYES: Okay. So you don't do that.

21 MR. WILDE: We do not. We use the contracts we
22 have available.

23 CHMN. MAYES: All right. So if there are --
24 thank you, Mr. Lotts, appreciate that excellent
25 presentation.

1 If there are no other questions for APS, why
2 don't we move to TEP and then we will come back to
3 AEPCO.

4 Mr. Dion, you have an individual on the line for
5 us, I understand.

6 MR. DION: Madam Chair, Commissioners, just for
7 the record, Phil Dion, vice president of public policy
8 for UniSource Electric Corporation. And I do have more
9 than one. I have three individuals, Mr. Erik Bakken and
10 Andy Hoekstra and Mark Mansfield who will be listening
11 in; although, they should be on mute. So they can go
12 ahead and undo it if they were listening. And if they
13 speak, if they please identify themselves for the
14 record.

15 Madam Chair, just quickly, one of the things I
16 did want to mention is regarding the public policy of
17 this. Some of the things that we at TEP have looked at
18 besides the individual water usage and power plants is
19 in our renewable policy. As this Commission knows, we
20 have looked at solar photovoltaic and, up in
21 UNS Electric's service territory, wind. And we have
22 identified those projects as good projects. One of the
23 things that we did consider is the water usage.

24 Additionally, this issue is broader than just
25 the power plants for us. One of the things that EPA is

1 looking at currently is particulates and particulate
2 matter. And we may get a couple more counties in
3 Arizona that go nonattainment. And Pinal is one of
4 them, Pima, and actually a couple other service
5 territories as well that we are looking at.

6 So some of the things that we are looking at are
7 outside of the -- also affect the water usage because in
8 those areas, especially in the rural areas, folks use
9 water to keep the particulates down, especially on the
10 paved road, excuse me, on the nonpaved roads. So one of
11 the things that we are looking at is looking in those
12 areas, seeing what we can do in those counties, paving
13 perhaps some of those roads, kind of get a "two for," if
14 you would, save water and we also get to work within
15 our -- the particulates that are in each individual
16 zone. So it is a, it is a -- we are taking a global
17 solar look at water.

18 But the experts, such as they are, are on the
19 phone and they are available for questions.

20 The other thing I would say, my understanding is
21 the Commission might come down to Tucson for an
22 externalities open meeting down in Tucson. And we would
23 certainly have a similar presentation that APS did this
24 morning, perhaps with some more insight what is going on
25 after this one. But that's, that's up to the Commission

1 and we are just making ourselves available.

2 CHMN. MAYES: I should certainly hope so. And I
3 would expect, since the Commission is coming down into
4 your service territory to discuss externalities, that
5 you will be there and your people will be there in
6 person to provide this information to us. So...

7 MR. DION: Absolutely, Madam Chair.

8 CHMN. MAYES: Okay.

9 COM. NEWMAN: Madam Chair, just quick.

10 CHMN. MAYES: Can I --

11 COM. NEWMAN: Yes.

12 CHMN. MAYES: If I could just start by asking a
13 few questions. And the individuals on the phone are
14 generation experts?

15 MR. DION: Yes, Madam Chair, as well as
16 environmental.

17 CHMN. MAYES: Okay. And I guess, you know, what
18 I would like to get from your folks is the same
19 information that APS provided with regard to its
20 generation fleet, you know, and in particular what
21 plants use groundwater and in what percentages, what
22 plants use effluent and in what percentages, what plants
23 use CAP water and in what percentages, what are your
24 current plant cooling methodologies and what is your
25 position -- this may be for you, Mr. Dion -- on pricing

1 water costs internally and in particular marginal cost
2 pricing.

3 MR. BAKKEN: This is Erik Bakken. I manage the
4 corporate environmental services department. I also
5 have with me the vice president of generation, Andy
6 Hoekstra, as well the general manager of energy
7 resources, Mark Mansfield.

8 In terms of our water resources at our
9 generating facilities, we have a variety of resources
10 that we use at our remote plants. We have surface water
11 usage as well as effluent in one of our plants in New
12 Mexico. For those plants that are operated by TEP, we
13 primarily use groundwater resource.

14 In terms of our current plant cooling methods,
15 primarily we use traditional wet cooling towers. And
16 our consumption profile at this point on average
17 throughout our system is approximately 5- to 700 gallons
18 per megawatt hour.

19 If would like more specifics than that, I would
20 be happy to answer any other questions that you might
21 have.

22 CHMN. MAYES: Sure. And could you be specific?
23 We have a court reporter. This proceeding is going to
24 hopefully lead to something, so we want to be as
25 specific as we can.

1 Can you tell us, as I said, which of your plants
2 use groundwater, which of your plants use effluent,
3 which of your plants get CAP water. And you have said
4 all of your plants use wet cooling. I guess that
5 answers that question, but...

6 MR. BAKKEN: Yes. In a little bit more detail,
7 like I mentioned, the plants that TEP operates, which
8 would be our Sundt generating station; Springerville
9 generating station; Valencia, which is operated by a
10 subsidiary of UniSource Energy Corporation, UniSource
11 Energy Services; Black Mountain generating station, are
12 groundwater water resource, use groundwater resources.

13 Our remote plants at Four Corners, San Juan, and
14 Navajo, our interest in those plants is primarily
15 surface water. And another gas-fired plant in New
16 Mexico, Luna generating station, has a mixture of both
17 effluent and groundwater water resources that are
18 utilized.

19 CHMN. MAYES: Okay. And then APS presented a
20 chart. Thank you for that. APS presented a chart to us
21 that I would like TEP, UniSource to duplicate that,
22 provide percentages of its overall fleet for effluent
23 groundwater or surface water. And can you, so can you
24 calculate the percentages, can you calculate the water
25 usage by percentage?

1 MR. BAKKEN: Yes, you know, I think we could do
2 that. Again, I apologize for not being there in person
3 today. But with just a little bit more analysis I think
4 we could certainly come up with that type of information
5 for you.

6 CHMN. MAYES: Okay. And I know my colleagues
7 have questions. But are you examining -- it sounds like
8 APS is undertaking an examination of a hybrid dry
9 cooling or dry cooling on both base load and combined
10 cycle plants. Is TEP engaged in any similar analysis?

11 MR. BAKKEN: Yes. To the extent that we have
12 plans for expansion of any of our generating facilities,
13 we are taking a look at the possibility and the
14 probability of using dry cooling techniques. And that
15 would be done in conjunction with an outside third-party
16 expert.

17 CHMN. MAYES: So you also will have that, a
18 study underway?

19 MR. BAKKEN: That's correct.

20 CHMN. MAYES: Is that part of your resource
21 planning process?

22 MR. BAKKEN: Yes, it would be.

23 CHMN. MAYES: Okay. And are you making an
24 assumption, as it would appear APS is, that any future
25 generation, especially combined cycle, would be at least

1 hybridized dry cooling?

2 MR. BAKKEN: That is one of the alternatives
3 that we are looking at, that's correct.

4 CHMN. MAYES: Okay. So you are not making that
5 assumption that it would be -- I am sensing a difference
6 between TEP and APS on this issue.

7 Mr. Dion.

8 MR. DION: Madam Chair, I think the answer of
9 APS is similar to the one that Mr. Bakken is giving you,
10 essentially that we would look at the economics of it
11 but that if -- one of the things Mr. Bakken just spoke
12 about is we are looking at it as very probable in the
13 future for the licensing of a new plant, especially by
14 this Commission. It is certainly entered into the queue
15 of things that we are thinking of. But I think we would
16 view it as something very highly probable.

17 CHMN. MAYES: Commissioner Newman, did you have
18 questions?

19 COM. NEWMAN: No. It was more procedural than
20 anything else. I thank the gentlemen for being on the
21 phone and I thank Mr. Dion for bringing them here. And
22 I just, it was -- I just wanted to be part of the record
23 that we had a discussion in our Staff meeting this past
24 week about the Tucson meeting in which, you know, we are
25 hoping to have water, eminent water experts, both Sharon

1 Megdal and the law professor from ASU -- Kris, you have
2 to tell me. Not Pasualetti. The U of A law professor.

3 CHMN. MAYES: Oh, Glennon.

4 COM. NEWMAN: Mr. Glennon, Dr. Glennon.
5 Professor Glennon is also going to be there to
6 supplement this record. And I was looking forward -- I
7 can't believe I forgot his name, but just that kind of
8 morning. But he has just written a national best
9 seller, international best seller book on water. It is
10 the water-power nexus. And water in general is very
11 good. And I wasn't sure if TEP was going to be there to
12 give presentation. But it would be a very, very good
13 thing if they did down there as well for the Tucson
14 folks. And we are still trying to figure out how to
15 include perhaps that into this record. That's all.

16 So hopefully we will be able to sort of supplant
17 that record with what, with -- this record with what is
18 going on in Tucson as well, not to duplicate but to take
19 into account people's schedules and also get the
20 externality discussion on the water-power nexus going on
21 in southern Arizona as well. And I was doing my best to
22 convince all the Commissioners or as many as possible to
23 attend that, especially my friend Commissioner Pierce.
24 Thank you.

25 CHMN. MAYES: Mr. Dion, if the Commission were

1 to price water as an externality, what methodology
2 should we choose? What is TEP's position on that? And
3 then I don't know if he, if I asked this of Mr. Guldner,
4 but I would like Mr. Guldner to respond to that as well.
5 And then I am going to open it up to the audience.

6 MR. DION: On --

7 CHMN. MAYES: While you are thinking about that,
8 let me ask you another question.

9 MR. DION: That's a tough question, Madam Chair.

10 CHMN. MAYES: Has your utility done a
11 contingency analysis of its plant operations under
12 extreme drought conditions, what plants might have to be
13 backed down or could be threatened under extreme drought
14 conditions?

15 MR. DION: And, Madam Chair, I will follow my
16 good friend Mr. Guldner in getting the real experts on
17 the line, are actually on the line for that one. I know
18 we have done that but I would really like to talk to
19 Mr. Hoekstra, our vice president of generation, or
20 probably Andy would be the best one to answer that
21 question.

22 CHMN. MAYES: Okay.

23 MR. DION: Did you hear that question, Andy?

24 MR. HOEKSTRA: Yes, I have. Those studies were
25 primarily done at our participant facilities at Navajo,

1 San Juan primarily relative to possible drought
2 conditions. It also involved the -- it primarily
3 evolved around, for instance at San Juan, of being able
4 to, during drought conditions, being able to have
5 alternative water sources.

6 One of them that is being studied currently is
7 effluent from the City of Farmington, also being able to
8 obtain water rights from neighboring tribal communities,
9 and also, in the case of the Navajo generating station,
10 relative to water levels in Lake Powell and the ability
11 to access those, the water levels at lower levels.

12 CHMN. MAYES: Because you get water out of Lake
13 Powell?

14 MR. HOEKSTRA: At the Navajo generating station,
15 correct.

16 CHMN. MAYES: Okay. And so your contingency
17 studies have examined what you would have to do in the
18 alternative if water levels continued to decline at Lake
19 Powell?

20 MR. HOEKSTRA: Correct.

21 CHMN. MAYES: Okay. So this is very interesting
22 information. I have never heard this before. And I
23 think it is fascinating actually. It is why we are
24 doing these workshops.

25 So it sounds like the utilities have done these

1 contingency analyses. And I guess my next question for
2 Mr. Hoekstra is: Have you analyzed the cost of
3 achieving those alternative supplies of water? I assume
4 if you are going to get effluent from Farmington that
5 involves bringing in a pipeline from Farmington.

6 MR. HOEKSTRA: Correct.

7 CHMN. MAYES: And what is the cost of having to
8 bring in a pipeline and buy effluent from Farmington,
9 which presumably is going to price that such that it
10 benefits the City of Farmington?

11 MR. HOEKSTRA: You know, I don't have those
12 numbers available.

13 CHMN. MAYES: That's okay, Mr. Hoekstra. Can
14 you supply that study to the Commission?

15 And I would ask the same for APS, any drought
16 contingency studies that it has done on its generating
17 units.

18 Mr. Dion, can you do that and supply it to this
19 docket so the public has access to those studies?
20 Mr. Dion?

21 MR. HOEKSTRA: Yes, we can.

22 MR. DION: Yes, Madam Chair, certainly we can do
23 that.

24 CHMN. MAYES: Okay. When were those studies
25 conducted?

1 MR. HOEKSTRA: Those studies have been conducted
2 in the, since somewhere around the mid 2000, 2004 or
3 2005.

4 CHMN. MAYES: And has there been one done since
5 then, Mr. Hoekstra?

6 MR. HOEKSTRA: I believe we are still
7 negotiating and performing studies at our participant
8 facility at San Juan.

9 CHMN. MAYES: Okay. Mr. Guldner, do you have --
10 obviously you are a participant in some of these plans
11 that they were discussing, Four Corners being one of
12 them. I take it you are a participant in that same
13 study at Four Corners.

14 MR. GULDNER: Yes.

15 CHMN. MAYES: Okay. And, then, and you will
16 commit to supplying any other studies of drought
17 contingency on your other plants?

18 MR. GULDNER: Yes.

19 CHMN. MAYES: Okay. On the externality
20 question.

21 MR. GULDNER: Chairman Mayes, I don't think we
22 have strong objections if the Commission decides to put
23 in the resource planning rules marginal versus, I guess,
24 call it embedded cost. That's, ultimately the challenge
25 is where, when you are doing resource planning, we need

1 to know what analysis to use so that we can propose the
2 lowest cost or the best fit of the resource.

3 Our folks, in looking at the Utah study, I think
4 we will have to develop the expertise to understand how
5 to do a marginal cost, because it certainly, you know,
6 you can look at what your current resources are,
7 marginal cost means you have got a forecast of what the
8 cost is under different assumptions. So we would have
9 to develop, you know, some different internal skill sets
10 to be able to do that. But ultimately we think that's
11 why this workshop is important, so we can determine what
12 inputs we use when we do that analysis.

13 CHMN. MAYES: Right. And so I guess the company
14 so far has not done a marginal cost pricing analysis?

15 MR. GULDNER: I don't think in the resource
16 planning -- again, as you heard with Mr. Lotts, you go
17 through and you want to make sure before you propose as
18 part of the siting process -- in fact, almost always
19 water is a major issue, as you know, so companies are
20 out acquiring water rights. And you typically know what
21 the cost of the water is going to be at the time you are
22 moving forward with construction of a power plant. And
23 so I don't believe we have done, in the resource
24 planning, a marginal cost forecast that we have used
25 what we think is the internal cost of water.

1 CHMN. MAYES: And this may be a question,
2 Mr. Guldner, for the next workshops, for the utilities
3 to come back having done some homework, but what would
4 be involved in conducting a marginal price costing, a
5 marginal pricing of water as an externality, what inputs
6 would go into that? What does APS and TEP and the other
7 utilities believe ought to go into it?

8 MR. GULDNER: And I think that is it exactly.
9 We would have to go back and look again. And I think we
10 are looking at some of the studies and also other
11 studies to see how this is being done other places.

12 Water is one of the easier ones, I will say, to
13 probably tackle out of all the subject matter that is on
14 the plate for externalities analysis. But, you know, we
15 will certainly pull that together and hopefully come
16 back and give you more detail on that.

17 CHMN. MAYES: Yes, Commissioner Newman.

18 COM. NEWMAN: Yes, to this point. To this point
19 really, I have, I have been thinking about this now.
20 That's one of the reasons why in my opening statements I
21 said, you know, this is not going to happen overnight.
22 It is going to take some time. And one of my ideas was,
23 I don't know whether my colleagues will buy it or not,
24 or it could help to have an outside party working with
25 the Commission, you know, and perhaps even DWR or

1 whatever related agencies associated with air or water
2 on some of these, but my idea was to have some, a third
3 party, not necessarily the same third party that did the
4 Utah study; although, I think that they are a good
5 organization. I met the individuals and they similarly
6 were interested in the project.

7 But it will help us. It will help not, sort of
8 not doing apples and oranges, so we are on the same
9 page sort of setting up the framework of what we can be
10 talking about. And I think marginal pricing is part of
11 that analysis.

12 And the only other matter would be trying to
13 figure out to find a sum of money to do that study. And
14 I don't think it is absurd -- I think it is reasonable
15 expenditure. It is just a matter of trying to figure
16 out if the Commission would be able to find that. I
17 heard through the grapevine talking to folks that we
18 could be able to get money to do such an important
19 study.

20 And so I wanted to just put that into the
21 record, that I am not, I don't think we need to put the
22 total burden on the utility companies. We need to be
23 working in tandem with some objective outside party.

24 CHMN. MAYES: Okay. Commissioner Pierce.

25 COM. PIERCE: Thank you, Madam Chair.

1 Mr. Guldner, I just had a comment as I think
2 about the deal that you, that APS made with Phoenix.
3 And that shows that the market itself is starting to
4 take care of some of the issues that I have with the
5 negative externality of this and how much water gets
6 used. But some of these long-term agreements, I look at
7 like some of the economic development agreements that
8 are made with taxes and seeking to attract business to a
9 community and using perhaps taxes or in some cases cheap
10 water. And those concepts are a little bit shortsighted
11 because you have to look at the long term of being able
12 to have enough water for the communities to survive, at
13 the same time having jobs, and so that balancing there.

14 And so just as in the -- I think food is
15 undervalued for those, that's why there are a lot of
16 subsidies out there, the real cost of food to us. We
17 think, well, this ought to be this cheap, it has always
18 been, but it doesn't even reflect what the cost of
19 production really is. So I think the market is starting
20 to take care of some of these issues.

21 But for me, I look at it because we see so much
22 of it. A community may be looking at maybe one deal,
23 but we see so much of it, if something really stands out
24 that it is a bad deal. In my view, water is not being
25 valued in this deal. To me it is just like some of the

1 other bad deals I have seen take place where perhaps a
2 builder/developer or somebody gets a CC&N, comes to us,
3 and this hasn't happened since I have been here, but in
4 the past, water has been undervalued to help sell out a
5 project or make, you know, to move homes faster. And it
6 is not good for ratepayers down the road. It is not
7 accurate. And it is just, to me it is just getting good
8 information, getting it and having water place the value
9 on the market and looking into the future. And that's,
10 to me, that's at the crux of this.

11 MR. GULDNER: Chairman Mayes, Commissioner
12 Pierce, I think that's right. I think that's the
13 challenge with this. The marginal cost is, it is how do
14 we tag that value, how do you determine what that value
15 is. It is certainly easier to just go back to what your
16 current contracts are and to look at that. So I think
17 that's the additional skill set. You have to be able to
18 do that marginal cost analysis. And it is not as
19 clear-cut an answer but it is something.

20 COM. PIERCE: We may not have enough water to
21 hang around to enjoy the electricity.

22 COM. NEWMAN: There are some people that believe
23 it.

24 CHMN. MAYES: I think this is a really good
25 discussion, Commissioner Pierce, a really good point.

1 And I am just looking at the marginal cost
2 pricing section of the Utah report, Mr. Guldner. And it
3 states, actually it is very similar to what Commissioner
4 Pierce just said, and talks about, you know, the
5 scarcity of water rights in the west. It says water
6 rights in Utah are completely allocated, in some regions
7 overallocated, meaning any party wishing to acquire new
8 or additional water rights must find another party that
9 is willing to sell them. Sounds very much like Arizona
10 in a lot of ways.

11 COM. NEWMAN: Exactly.

12 CHMN. MAYES: But then it goes to describe how
13 they did marginal cost pricing in this report. It says
14 an estimate of the marginal cost in Utah was achieved
15 through a survey of the database of water transactions
16 in the 12 western states, maintained by the Bren School
17 at the University of California, Santa Barbara. The
18 source of these transactions is the monthly trade
19 publication, Water Strategist, and its predecessor,
20 Water Intelligence Monthly, published by Stratecon, Inc.
21 in Claremont, California. So they did it in Utah, under
22 a republican governor I will add, using this data.

23 Is it as complicated as you would seem to lay
24 out? I mean maybe, I don't know, you know, and this is
25 really a fundamental question, is it something that the

1 Commission can do in workshops or, as Commissioner
2 Newman has suggested, is it something that has to be
3 hired out to a consultant?

4 MR. GULDNER: Chairman Mayes, I don't
5 necessarily think it has to be complex. I think you
6 want to sort through some of the issues, like, in
7 Arizona, what happens when you convert a, I can't
8 remember my water rights stuff, but like a type 3 to a
9 type 1. There are some different subtleties in Arizona
10 water law. And as you move into effluent, that probably
11 is looking primarily at just surface water rights. So
12 we have got some nuances on it.

13 But from a standpoint of what inputs do you put
14 into the resource planning study, that could be the way
15 you go, just say you use the data from an accredited
16 database, and that certainly makes it easier to do that
17 analysis. It may then be a little different what
18 actually happens when you go to secure the rights, but
19 in terms of what you are looking for, if you are looking
20 for relative to the rest the water rights in the state,
21 don't really care what you get it for, if you get it
22 cheaper that's great, but from a planning standpoint, we
23 want to value it at what the marginal cost of water
24 across the state is. I mean I think that makes sense.

25 CHMN. MAYES: Okay. All right. I want I know,

1 we are going to take a break here soon for lunch, but I
2 do want to, before we do that, go to AEPCO real quickly
3 and then throw it open to everybody to discuss some of
4 these issues. Then I want to come back after lunch and
5 continue to discuss them before we have the next
6 presentation.

7 So speak into the microphone. If you can, state
8 for the record, sir.

9 MR. ANDREW: Chairman Mayes, Commissioners, my
10 name is Jim Andrew. I work for AEPCO as manager of
11 regulatory affairs and planning.

12 Apache generating station is the only plant that
13 AEPCO has. It is located in southeast Arizona in the
14 middle of an agricultural area. The water source for
15 Apache station is solely groundwater. There are three
16 steam electric generators at the facility. Two of them
17 are coal-fired base load units and one of them is a
18 natural gas-fired steam peaking unit. They use wet
19 cooling exclusively.

20 AEPCO does not have plans to build any new
21 generation at this time, but should that come, should
22 that come up in the future, dry cooling or hybrid
23 cooling would be something that we would evaluate and
24 consider at that point.

25 Right now I believe the plans are through the

1 Southwest Power Resource Group that is looking at our
2 generation needs into the future, along with a number of
3 other small entities such as irrigation districts and
4 small municipalities. They are looking at taking power
5 from a plant that already exists. So it is basically
6 purchased power or operating at a power purchase
7 agreement.

8 For AEPCO, no formal contingencies have been
9 analyzed on extreme drought conditions. However, we
10 recognize that we are in competition for available water
11 sitting right in the middle of an agriculture area in
12 Sulphur Springs Valley. From that perspective, we also
13 recognize the increasing value of water conservation and
14 water reuse, which we employ at this time. And we are
15 always considering how we can make that better and
16 reduce our reliance on the amount of groundwater that we
17 have to use for Apache generating station.

18 In addition, we are looking at water treatment
19 advances that can increase the cooling tower cycles, the
20 amount of times you can put the same water through the
21 cooling tower before you have to replace it with fresh
22 water. And ultimately that will reduce our water
23 requirements as well.

24 And the graph that you asked to be annotated is
25 going to be real easy for us, yeah.

1 CHMN. MAYES: Okay. And thank you very much for
2 coming up, by the way. I appreciate that.

3 Have you given any thought to the issue of
4 pricing water as an externality and how that, how that
5 should be done?

6 MR. ANDREW: I have not, but I made notes on it
7 and I will certainly ask the appropriate people and come
8 back with an answer.

9 CHMN. MAYES: That would be great. Thank you
10 very much.

11 Okay. Any other questions of AEPCO? Great.

12 COM. NEWMAN: I just wanted to thank him for
13 coming up as well.

14 CHMN. MAYES: Okay. Let's -- do we have the
15 microphone? Nancy, could you take the microphone to the
16 floor. And we will open it up for comments on the
17 issues that have been raised by the Commissioners and
18 the utilities and that are listed on our agenda, agenda
19 items -- well, let's just say all of the agenda items
20 listed. And that's, that's the microphone. Make sure
21 it is on.

22 Basically the way we do it is anybody can start.
23 Why don't we, why don't we -- well, let's just go ahead
24 and, Mr. Schlegel, do you want to begin?

25 MR. SCHLEGEL: Sure, I will begin.

1 CHMN. MAYES: Okay.

2 MR. SCHLEGEL: Jeff Schlegel for SWEEP,
3 Southwest Energy Efficiency Project. Thank you for
4 being drafted -- I mean thank you for opening this
5 opportunity for public comment and for addressing this
6 issue.

7 As you know, water is a very important issue in
8 our state. And I appreciate your focus on the water and
9 energy nexus today. I am going to speak to the
10 relationship between energy efficiency, energy use, and
11 water use, quite a bit, a part of which you have covered
12 this morning or other speakers covered this morning.

13 As you know, saving energy saves water, and vice
14 versa, saving water saves energy. Saving energy reduces
15 water use used to cool the generating plants, quite a
16 bit of the discussion this morning. But saving water
17 also at power plants and at customer facilities also
18 saves energy by reducing the energy use for pumping and
19 the distribution of water. That's a question I have
20 been asking for years in Arizona, how much of the total
21 energy that Arizona consumed is used for water
22 distribution. And I have yet to get an answer. I am
23 still looking for that answer, but I certainly would
24 like to know. I think it is very important to attack
25 these challenges, both the energy challenge and the

1 water challenge, from both sides, because, again, saving
2 one saves the other and vice versa.

3 Energy efficiency analysis and cost
4 effectiveness analysis of energy efficiency programs, to
5 the extent that the cost of cooling water is included in
6 the avoided costs of energy, with a proper price for
7 energy, then the cost effectiveness analysis includes
8 the reduced water use as an energy efficiency benefit,
9 again to the extent that those things are true.

10 As part of our, SWEEP's, input and review of the
11 2010 energy efficiency implementation plans and the
12 upcoming 2011 plans, SWEEP will check on this and report
13 back to you. We are not sure it is being done properly,
14 but we think the energy is included in the operating
15 costs -- the water, excuse me -- the water savings are
16 included in the operating costs, but we don't know if
17 they are properly included or included in the types of
18 pricing you are talking about today.

19 CHMN. MAYES: And, Mr. Schlegel, to this point,
20 isn't that -- I mean that's sort of a big part of
21 pricing, the need to price water as an externality
22 properly, which is that gets plugged into our societal
23 cost test. And if it is simply at the embedded costs,
24 that's one thing. Obviously you are saving water, and I
25 think we do measure that or we include that. But if it

1 were at the marginal cost, which is the cost of
2 achieving the water at the next unit, which could be
3 much, much higher than the embedded cost as I understand
4 it, that would make those energy efficiency measures
5 even more cost effective than they already are.

6 MR. SCHLEGEL: Madam Chairman, that's correct.
7 And that was going to be my next point, but you just
8 made it so I will skip over that.

9 CHMN. MAYES: Okay.

10 MR. SCHLEGEL: There is one thing about pricing
11 water in the avoided costs. The price of energy is
12 another thing, you know, how it is priced as -- how it
13 is monetized as an externality.

14 In addition, the water savings for customers for
15 things like clothes washers and spray valves, they are
16 currently reported to the Commission only in gallons,
17 not in dollars. So those water savings are not
18 monetized at all, not the embedded or marginal price.
19 And they are not included in the cost effectiveness
20 analysis. And, therefore, the benefits for energy
21 efficiencies are under reported in that way as well.

22 So we believe, SWEEP believes it is important to
23 monetize water to accurately document the economic
24 benefits of the energy efficiency programs in all the
25 ways that we discussed today. There has been a lot of

1 discussion today about pricing water and about
2 monetizing the price of water, the externality price of
3 water.

4 I would submit to you that currently the price
5 being used for customer water savings in your analyses
6 is zero. That is the price; it is not like there is no
7 price. The price that people are using is zero. And
8 that by far is probably the worst price we could use.
9 Water has some value but currently it is valued at zero
10 for water savings associated with the programs.

11 CHMN. MAYES: Okay. So I was wrong actually.

12 MR. SCHLEGEL: That's from the customer savings.
13 You were right for the operating costs associated with
14 the power plants saving, but for the customer water
15 savings that are a co-benefit with some of the energy
16 efficiency programs, that's where the value is zero.

17 CHMN. MAYES: Okay.

18 MR. SCHLEGEL: And to conclude, SWEEP will
19 review the documents on the record and may submit
20 additional documents for your consideration relating to
21 energy efficiency and water use and pricing water
22 relating to energy efficiency programs.

23 So with that, thank you and happy to answer any
24 questions.

25 CHMN. MAYES: Thank you.

1 MR. SCHLEGEL: Or pass microphone.

2 CHMN. MAYES: Commissioner Newman.

3 COM. NEWMAN: Yes, one question for Jeff.

4 Mr. Schlegel, Madam Chair, I know that we have a
5 tendency to think that we could do the analysis
6 within -- and I have sort of a behavioral scientist kind
7 of background besides being a lawyer and I always think
8 it is good to sort of have a third party look at stuff
9 as well.

10 What do you think about the idea of doing a
11 similar thing what Utah did to contextualize the
12 discussion to create parameters of what we are looking
13 at in each category, of having a third party, sort of
14 objective entities being involved with that? And what
15 are the chances of this Commission, if all five
16 Commissioners agreed or if the majority agreed, what are
17 the chances of getting funding for such a thing, for
18 such a study?

19 MR. SCHLEGEL: Madam Chairman, Commissioner
20 Newman, I appreciated the Utah study. I wish we had
21 that study for Arizona. I think that was a good study.
22 It was done by a reputable firm. I think it helped
23 inform the discussions. I think independent studies
24 like that can move the process along. It is possible
25 for Arizona stakeholders to meet together and to develop

1 values ourselves. I think an independent review of
2 values can contribute to that discussion and generally
3 can accelerate the discussion. So I think it is a good
4 idea.

5 The challenge -- second question is the
6 challenge, the funding to do that. I think the benefit
7 of an independent study is not only in its independence
8 but it is also getting the work done. There is a lot of
9 work going on in Arizona. I know your Staff are busy.
10 The utilities are very busy on a number of different
11 projects. And having somebody else put something on the
12 table and take the first step, it, I think, would help.
13 But as you yourself noted, funding for such a study can
14 be a challenge. I am not sure, I haven't identified a
15 funding source myself that could, you know, could do
16 that.

17 I mean it depends how much of a priority it is
18 for you and how broad a scope you want to do. There are
19 measurement research and revaluation studies that look
20 at benefits and co-benefits of the energy efficiency
21 programs. And at least that component, I think, could
22 be funded out of an independent study. The utilities
23 could pool together their energy efficiency evaluation
24 and research monies that are in all the budgets that you
25 have approved and pool some of that money together and

1 fund a very, you know, specific study associated with
2 the programs, or you may identify other sources, but I
3 think that is a good thing.

4 But even in the absence of an independent study,
5 what I have been saying about this issue for several
6 years now is that let's at least get it started. A
7 number of the different values that are used for water
8 or carbon or, you know, NOx, those values, unless they
9 are incorporated in the energy price explicitly, unless
10 they are already incorporated, those values generally
11 are zero. And we know that zero is the wrong value for
12 all of those emissions and water use.

13 So I have proposed, you know, for example, one
14 proposal I made was just for the environmental staff of
15 the utility to get together in one meeting, propose a
16 round of numbers and put those numbers on the table for
17 all the stakeholders to consider. I think that could be
18 done within a matter of weeks or matter of months, you
19 know, if people really want to discuss it. I think what
20 is most important is to get off of zero. Zero is the
21 wrong number.

22 COM. NEWMAN: Thank you, Mr. Schlegel.

23 CHMN. MAYES: Well, I think that's very
24 interesting. And I appreciate, Mr. Schlegel, you
25 bringing that up. I agree zero is the wrong number. So

1 the question is what does the Commission want to do next
2 and do we want to direct such a stakeholder process to
3 begin.

4 But would any one else like to jump in here and
5 provide comment?

6 (No response.)

7 CHMN. MAYES: Oh, come on, don't be shy.

8 COM. NEWMAN: Mr. Patterson?

9 CHMN. MAYES: A lot of shy folks in the audience
10 today. Anyone else on the issue of externalities and
11 water?

12 MS. MODESTO: I had a comment.

13 CHMN. MAYES: Sure.

14 MS. MODESTO: My comment is related --

15 CHMN. MAYES: Could you state your name.

16 MS. MODESTO: My name is Karen Modesto. My
17 comment is regarding the use of groundwater for
18 electricity generation and your comment regarding the
19 GRD.

20 I know that with the GRD you are withdrawing
21 water in one area and recharging it in another.
22 However, you still have to demonstrate physical
23 availability of those supplies. The 100-year supply
24 usually relates to residential development. And a
25 different type of groundwater withdrawal right is

1 required for a general use permit. That, of course, is
2 only within the AMAs.

3 So it just needs to be kept in mind that
4 physical availability of supply still has to be
5 determined before you can just drill a well and start
6 using the groundwater.

7 CHMN. MAYES: Sure. And I guess what I was
8 concerned about was, you know, I have seen maps that
9 have been done by DWR recently that show groundwater,
10 the groundwater table being depleted, frankly, and
11 groundwater levels declining significantly over the next
12 50 years. And for those water companies and electric
13 companies operating in those areas, specifically the map
14 I am thinking shows groundwater depletions all
15 throughout the Phoenix AMA, it may very well lead to, as
16 Commissioner Stump pointed out earlier or mentioned,
17 referenced earlier, the need to drill deeper wells,
18 potentially increase in costs of operating electric
19 units or electric generating plants in those areas.
20 That's all I was referring to.

21 MS. MODESTO: Right. I just wanted to make that
22 point about the GRD. And also the --

23 THE REPORTER: Excuse me. I can't hear you very
24 well.

25 MS. MODESTO: Can you hear me now?

1 The water supply is limited. And so usually
2 when they look within an AMA for a groundwater supply,
3 they have to show there is sufficient supply for that
4 time of use, but it definitely has an impact on the
5 supplies. But it is really how we are looking at it
6 basically on the current rules for determining water
7 supplies by the Department of Water Resources.

8 CHMN. MAYES: Right.

9 MS. MODESTO: Which also brings another point in
10 mind, that currently Department of Water Resources is
11 losing staff left and right and really can't evaluate
12 the supplies like they should be, nor collect the data.
13 So...

14 CHMN. MAYES: You know, I thank you for that.
15 Was it Ms. --

16 MS. MODESTO: Modesto.

17 CHMN. MAYES: Modesto. Thank you very much for
18 raising that point. And I was going to mention it
19 earlier.

20 You made my point, which was I am terribly
21 concerned about what is happening to the Department of
22 Water Resources. They are, they have undergone
23 significant cuts already, may undergo significant more
24 cuts over the next year or so. And, frankly, I don't
25 know what we are going to do. I mean it is utterly

1 unbelievable and devastating what is happening to DWR
2 and, from my standpoint, appalling. This Arizonan is
3 appalled by what has happened to DWR. And I think it
4 places our entire state's water future in jeopardy quite
5 frankly. And it puts even more pressure on the people
6 sitting in this room, our utilities, this Commission,
7 all of the stakeholders to fill in that knowledge gap,
8 which is very hard to do. I mean so I appreciate your
9 point. And I don't know what we can do about it except,
10 you know, redouble our efforts in this regard.

11 Commissioner Newman, are you still on the board?

12 COM. NEWMAN: Just quickly. Thank you for your
13 comments as well. And I just wanted to correct the
14 record on one thing.

15 It is true about the AMAs and 100-year water
16 supplies for 14 out of the 15 counties in Arizona.
17 Cochise County is the only county that adopted the
18 legislation and unanimously agreed that we have to be
19 under a 100-year water supply. We were the only county
20 to adopt on. Other counties could adopt on. But, so
21 that is a unique thing not a lot of people know about.

22 And I just wanted to, in the stream, I want to
23 hear public comment here, but in the stream of all
24 public comments and response to Mr. Schlegel, to expand
25 that and maybe challenge the utilities here right now.

1 This is a major resource planning area. And, you know,
2 if we should go to a third party, you know, review,
3 objective review, kind of setting up parameters, it
4 would behoove the major utilities, you know, to think
5 about using some of their resource planning dollars for
6 this. It would be helpful, number one.

7 Number two, also the -- it is just intrinsically
8 just a part of the resource planning. And this is going
9 to go forward, so, or they can perhaps help us, help the
10 Commission or even go out on their own communitively
11 asking for another source from any one of the different
12 groups that they belong to nationally, because this is a
13 national issue as well. But we want to bring it home to
14 Arizona.

15 So I am just challenging some of the utilities
16 in the room to put on their thinking caps on how we
17 might be able to finance this. There are a lot of smart
18 people in this room and I think that we could figure it
19 out, so environmental groups, industry groups, everyone.
20 Thanks.

21 MS. ORMOND: I am Amanda Ormond with Interwest
22 Energy Alliance. We represent solar.

23 And I think it is very interesting how much
24 discussion has been around water use and solar. And we
25 appreciate that. I am glad that this Commission is

1 actually looking at water use for all technologies,
2 because from our industry standpoint, we have had a lot
3 of discussion about just solar water use. And I think
4 we need to have it much more broadly.

5 When we look at solar water use, the problem is
6 we don't have a lot of plants to be able to look at and
7 see what the water use is going to be. There are not
8 very many reports that are out there that are really
9 very good. So we are really looking forward to having
10 plants in the ground where we can actually quantify what
11 the water use is.

12 The other point I will try to make is solar
13 technologies, with some of these technologies, we don't
14 know what the ultimate water use will be because they
15 are not mature technologies. When we look at water use
16 of natural gas or coal or nuclear, these are very mature
17 technologies. And we use less and less water over time.
18 When we put the first solar plant in the ground, it is
19 not going to have the most efficient water use because
20 it is new. Over time, and as the utilities get better
21 with these plants, then water use is going to go down.

22 So I caution a little bit looking at just those
23 first numbers on water use of solar because they are
24 going to be high because they are not mature. I think
25 as we go forward and look at water use related to solar

1 and other technologies, especially solar, we have to
2 look at plant by plant, where is the plant located. If
3 it is on old agricultural land and water use is less
4 like the Solana plant, that makes a lot of sense. But I
5 also think we need to be looking at water in the
6 resource planning context.

7 And I appreciate the Commission bringing
8 together these workshops as well as APS coming forward
9 and saying let's do some resource planning and put water
10 and all these other externalities in that. So I
11 appreciate the interest in this and will certainly be
12 working to bring the best information we can.

13 CHMN. MAYES: Thank you, and thanks for those
14 comments. And I think you are absolutely right, you
15 know. I mean I think solar gets tagged with this water
16 use issue and yet most forms of solar use next to no
17 water, I mean one gallon per megawatt hour, relative to
18 coal and nuclear, which are up in the 600s, or
19 5- to 600s.

20 MS. ORMOND: And wind, zero.

21 CHMN. MAYES: Wind, zero. So let's just keep
22 that in mind.

23 And I would add, Amanda, as you know, many of
24 the solar plants we have sited here at the Commission
25 over the last year and a half have actually been sited

1 in the alternative, either CSP or PV. It is my personal
2 view that a lot of those projects end up as PV. And all
3 of them have been on former ag land, basically, or have
4 ag rights, water rights associated with them.

5 MS. ORMOND: And let me just pick on my friend
6 over here, Ginger Ritter, with Game & Fish. Game & Fish
7 just came out with some solar guidelines recently and it
8 states in there they are recommending dry cooling. And
9 I think that we want to try to get to dry cooling for
10 all our power plants but I caution adopting a widespread
11 policy too early on because these technologies are new.

12 I think we need to get the utilities to get some
13 of these plants in the ground, allow them to have time
14 to work with them, become familiar with them, make sure
15 they are producing good energy and have great capacity
16 factors before we start clamping down saying everything
17 needs to be dry cooling. That's why I made the comment
18 about I think that things need to be looked at plant by
19 plant. You are not going to want to put high water use
20 plants in areas that are going to draw down groundwater
21 or have an effect on rivers. And this Commission has a
22 history of turning down at least one natural gas plant
23 that I am aware of because of water issues.

24 So I guess I would advocate for let's walk
25 before we run, let's start getting to know the

1 technologies before we try to adopt any kind of
2 overarching policy that says either hybrid cooling or
3 dry cooling, because you did hear this morning that
4 there are significant penalties to going to hybrid
5 cooling and dry cooling both in terms of how much energy
6 you have to use of the plant and also how much footprint
7 on land that you need to be able to do dry cooling for
8 solar.

9 CHMN. MAYES: Well, that's an excellent point.
10 And you would agree with me, Amanda, that that's
11 basically how it is going to be done right now. It is,
12 dry cooling and hybridized dry cooling is being normally
13 vetted in the line siting process on a plant-by-plant,
14 location-by-location basis.

15 MS. ORMOND: Correct.

16 CHMN. MAYES: Okay. And I know she hasn't
17 volunteered to speak but I am fascinated about this
18 new -- that Game & Fish is recommending dry cooling. Is
19 that the Arizona Game & Fish Department? And is there a
20 report that's available that you could provide to the
21 Commission in this docket?

22 MS. RITTER: Well --

23 CHMN. MAYES: And state your name for the
24 record.

25 MS. RITTER: Ginger Ritter, and I am with the

1 Arizona Game & Fish Department.

2 We have developed solar guidelines which are
3 just basically recommendations of how we would like to
4 see them developed. And so I could submit those. But
5 we don't have a report where we have looked at dry
6 cooling and wet cooling and hybridized cooling. We have
7 just kind of looked at what is out there for how much
8 water use. And taking that into consideration, the
9 amount of water that's available in Arizona and wildlife
10 habitats, that's why we are recommending more hybridized
11 and dry cooling. We are not totally opposed to wet
12 cooling but we don't approve of every plant being wet
13 cooling when there is other options.

14 CHMN. MAYES: Thank you. Could you provide that
15 to this docket?

16 MS. RITTER: Sure.

17 CHMN. MAYES: We can help you do that if you
18 would like.

19 MS. RITTER: Okay.

20 CHMN. MAYES: Thank you very much.

21 All right. Anybody else like to take a crack at
22 some of these issues? Mr. Moyes.

23 MR. MOYES: Thank you, Chairman Mayes,
24 Commissioners. Jay Moyes with Moyes Sellers & Sims.

25 I would like just to reinforce a couple points

1 that Amanda has made and, first of all, commend the
2 Commission for undertaking this study, investigation,
3 workshop forum and anything else that will help
4 illuminate the understanding and knowledge of the
5 interface between electricity and water.

6 I have been working in this arena, as
7 Commissioners well know, for a number of years. I
8 showed up today because my truck license plate is
9 H2OKWH. I thought this was something I just couldn't
10 miss. So I am not speaking here on behalf of any
11 particular client other than my own interest in the
12 subject.

13 I have been involved in siting, I think, more of
14 the new era of generation plants than anyone else,
15 starting with Griffith and Sundance and NAAP and
16 Coolidge, and then recently a couple of solar plants.
17 And the message that I have gleaned from all of that
18 with respect to the water issues, which the Chairman
19 does correctly say are clearly and thoroughly vetted at
20 the line Siting Committee level as well as here at the
21 Commission level, some in greater degree than others
22 depending on the situation, but that message is there is
23 not a one size fits all answer to this question.

24 And I think the Committee has done an excellent
25 job, as has this Commission, of looking at the facts of

1 each situation. And in those plants with which I have
2 been associated, there has been a wide spectrum of both
3 water factual situations from the siting standpoint as
4 well as solutions and creative approaches to providing
5 the water that's needed for the plants, Sundance using
6 CAP water. In the case of Coolidge, we were fortunate
7 in the location involving an irrigation district where
8 we were able to recharge in advance essentially the
9 total water requirement for the life of that projected
10 plant. It is a peaker so it doesn't use a lot of water,
11 simple gas turbines, doesn't have a steam cycle.

12 As Amanda alluded to, in the solar industry you
13 have CSP plants that are steam turbine completely,
14 therefore, compared to combined cycle gas plants, will
15 use more water. At the other end of the spectrum you
16 have photovoltaic plants, which will use minimal water
17 for basically washing the panels. And I personally am
18 inclined to agree with the Chairman's assessment of the
19 likelihood that most of the plants that you have now
20 approved end up being PV. As we saw in the case of the
21 Agua Caliente plant out in Dateland, which it appears
22 from my vantage point will be the first project to
23 actually go in the ground in Arizona, and that's likely
24 to happen very soon, farmland outside of an AMA, very
25 productive agricultural economy input from that project,

1 but by putting the solar plant on part the White Wing
2 Ranch, we were able to substantially reduce water use
3 and yet shifted the melon operation, which was the most
4 economically productive, to displace on the northern
5 part of the ranch the citrus operation that wasn't very
6 productive. It is a great win/win kind of combination
7 that fell very well in the White Wing Ranch but wouldn't
8 necessarily fit somewhere else, just like the advanced
9 recharging of CAP water in Coolidge worked well there
10 but wouldn't work at all in the Hualapai plant in
11 Kingman. So each situation is different and unique.

12 Another point that I want to make, and
13 Commissioner Newman sort of piqued my memory about this,
14 we find ourselves sometimes caught between contradictory
15 goals and objectives of different regulatory agencies.
16 The worst example of that that I have encountered in
17 connection with power plants was at the Sundance
18 facility down in Pinal County, surrounded by farmland
19 with not just gravel roads but a lot of those roads down
20 there are just dirt roads, and yet heavily traveled by
21 school buses and farm trucks and people living out there
22 in times of the year. In that Coolidge, Casa Grande,
23 Florence area, you know, the cloud dust is tremendous.
24 And the PM-10 issues are very significant there.

25 When we were developing Sundance, we proposed to

1 EPA a trade-off. And some of you, I don't think any of
2 the currently seated Commissioners were involved in that
3 case, but what we were proposing to do was to, instead
4 of installing about \$40 million worth of selective
5 catalytic reduction emissions control, which was a very
6 small incremental addition to the basic emission control
7 equipment and would have, and does now produce a very
8 incremental and small additional NOx reduction over what
9 the base system would have produced, we proposed to EPA
10 to instead pave some \$35 million worth of roads, which
11 at the standards in that area would have paved 75 to 80
12 miles of road in the area of that plant. The PM-10
13 reduction, the emission trade-off is a no brainer in a
14 situation like that, tremendous impact that would have
15 had on the county, the cities, the county.

16 Everybody strongly supported it, but Region 9
17 EPA couldn't be persuaded that that was a sound
18 trade-off that they could make. And as a result, we
19 ended up spending the \$40 million for SCR. We paved a
20 few miles of roads just out of a good faith effort but
21 it was all the plant could afford to do under the
22 circumstances.

23 Those are the kinds of things that shouldn't
24 happen. And I think to the extent that this Commission
25 and other agencies can continue to study and evaluate

1 and get better data on the interrelationship between
2 emissions, water use and other externalities and the
3 true costs of generation, a similar situation exists in
4 my opinion with regards to the true costs of solar and
5 renewables when taking into account the firming
6 requirement that those intermittent resources also
7 necessitate on a part of the utility's planning.

8 I will end my comments at that point. I just
9 congratulate and encourage the effort and remind that,
10 again, one answer just, you know, dry cooling for all
11 power plants, is too simple and it doesn't always work.
12 It is not always the best answer.

13 CHMN. MAYES: Right. And I appreciate those
14 comments, Mr. Moyes. And I think right now I agree with
15 you. I am not sure forever I will agree with you. And
16 that's why I wrote a letter to my colleagues suggesting
17 that we look at this issue of at what point do we
18 require at least hybridized dry cooling or dry cooling.

19 California, as you know, doesn't allow wet
20 cooling anymore. I don't believe they do. It is very,
21 very hard to do wet cooling projects in California.
22 And, you know, I am not, you know, I tend not to -- I
23 tend to believe that we ought to be flexible in some of
24 these areas. But when it comes to water, I think that
25 we are going to have to become increasingly rigid.

1 And so isn't there going to come a point where
2 we say, sort of a cutoff date where we say, all right,
3 yeah, Ms. Ormond pointed out we have had some experience
4 with these plants, but, you know, enough is enough, and
5 our water supplies are so precious, they are dwindling,
6 we have evidence of that from DWR, so we have to go to
7 at least hybridized dry cooling at a date certain?

8 MR. MOYES: I would concur with your general
9 assessment of what the future ought to hold from the
10 standpoint of water conservation. The only really
11 counterpart but sort of additional point I would like to
12 make, what I was glad I didn't hear was the word
13 exporting our water in the form of electricity.

14 CHMN. MAYES: I was about to bring that.

15 COM. NEWMAN: I actually thought about it,
16 Mr. Moyes.

17 CHMN. MAYES: We are going to hear it later
18 today.

19 MR. MOYES: That has always bothered me. I have
20 worked for 30 years for the agriculture industry in this
21 state on water issues. As you saw on the diagram, the
22 pie charts today, agriculture still uses the majority of
23 the water in the state to the huge economic benefit of
24 the state. And there is a whole lot of exporting that
25 goes on in that in order for industry to continue to

1 survive.

2 The cost/benefit analysis, however, on water
3 suggests in lots of places, and we are seeing this more
4 and more, and I think the Commission and the Siting
5 Committee have encouraged this, that the cost/benefit
6 may be greater to use that water for generation or use
7 that water for some other purpose as opposed to
8 exporting it in the form of agricultural crops.

9 But, again, I do agree generally that water
10 conservation is critical for the state as a general
11 rule, and under all circumstances we need to be using it
12 as efficiently as we can, whatever the industry.

13 CHMN. MAYES: Okay. Commissioner Pierce.

14 COM. PIERCE: Sure, and I appreciate it,
15 Mr. Moyes. But, and I recognize that whether it is
16 manufacturing, whatever we are manufacturing, that, and
17 I think part of the balancing is how many jobs does that
18 affect. And so I think it is all part of that, the
19 externalities of each of these things.

20 But I think what is really going to happen, that
21 will happen relatively quickly for me, is there are
22 certain regions of the state, and I agree with Amanda,
23 probably one size policy doesn't fit, because we have
24 different regions of the state that have a little more
25 water than other regions. And I would expect that if

1 someone wanted to put a power plant in and it really
2 wasn't advantageous to the region with employment, that
3 I would hope that the fathers of that community would
4 take a good look at that and really make a call on what
5 was important for them to have in desiring to build an
6 exporting generation plant and that's not something
7 that's for their own use.

8 So I think we are going to -- I mean I already,
9 I won't get into cases, but I am already thinking about
10 the areas that work and don't work. And just like
11 Dateland, having lived in that area, I know darn well
12 there is a lot of citrus that ought to not be there
13 based on the water that is consumed for the jobs and
14 production that's there, that there are better places
15 for citrus. And so there is some very obvious places to
16 put some of these facilities, solar facilities and other
17 facilities with access to transmission lines. I mean it
18 is, there are some really good places in this state.
19 And for me, that's a lot of it. I can see it. I can
20 recognize it. And I am already placing a value on it.

21 MR. MOYES: I agree. And I hope my comments
22 were not misinterpreted to think I am upset about
23 generation that may be exported. I think it is a
24 question of highest and best use. In certain
25 circumstances a generation plant may be the highest and

1 best use of that water in that locale. And, again,
2 always with the water issues, it is not so much that we
3 don't have enough, we just don't usually have enough in,
4 quite enough in the right places.

5 CHMN. MAYES: We are going to have to take a
6 break now. Come back around 1:30.

7 (A recess ensued from 12:39 p.m. to 1:45 p.m.)

8 CHMN. MAYES: Let's go ahead and get started, if
9 we could. We have a very special, I think, presentation
10 up next, a special guest here at the Commission. And I
11 know that all the Commissioners really appreciate Mike
12 Pasqualetti for coming down to talk to us. Mike is a
13 professor at the ASU School of Geographical Sciences.
14 He is also a professor at the Barrett Honors College at
15 ASU and teaches at ASU Policy Technic as well.

16 But what I know him for and what he is
17 increasingly known for is the fact that I think he is
18 the only person in the State of Arizona who has really
19 taken a good look at the water-energy nexus, especially
20 as it affects or as it -- the side of the equation that
21 involves energy, the energy-water nexus. And he has got
22 a great presentation. He has studied the energy-water
23 nexus and has taken a very close look at the exportation
24 issue associated with water use and energy that is both
25 used in Arizona and exported.

1 So without further ado, Mike Pasqualetti, if you
2 could, come and just say a few words.

3 MR. PASQUALETTI: Thank you, Madam Chair and
4 members of the Commission. I am speaking with you today
5 about energy and water. And I must say that I am
6 speaking for myself, not ASU or my wife or anyone else.

7 I do want to say that I am very delighted that
8 you are going to be talking about energy and energy
9 externalities because this is something that I have long
10 thought was a neglected topic, especially when comparing
11 energy resources and calculating their true costs. And
12 today I am going to address the matter of water and
13 energy as a part of that externality discussion. But I
14 must say that it is a very large topic and we are going
15 to be talking about just one part of it. There are many
16 other parts to it.

17 I am going to be talking about the water costs
18 of generating electricity. You can also be, of course,
19 speaking about the energy costs of providing water. And
20 even within those two broad topics, there are several
21 subdivisions. And one is how we better use water within
22 our cities to curb the urban heat island. And Professor
23 Ruddell is to my left behind me who, if there is time,
24 has comments about how you can reduce energy using water
25 to lower the urban heat island. But my specific topic

1 today is going to be the embedded costs of power and
2 what it suggests for the energy trade and power plant
3 technology, and renewable energy, which is something I
4 am quite interested in.

5 I am on the board of the Arizona Solar Center.
6 I used to be the chair of the Arizona Solar Energy
7 Advisory Council appointed by governor Napolitano.

8 Well, this is a picture here -- I am going to be
9 directing your attention to the slides. And we have
10 several photographs here. One of them on the left is
11 the Navajo generating station. And the stacks on that,
12 the chimneys are almost 175 feet tall, meaning that
13 plume coming off the cooling tower is several thousand
14 feet tall. It uses a substantial amount of water, of
15 course, coming from Lake Powell.

16 And in the top center part is the Cholla power
17 plant, another coal burning power plant, that has a lake
18 dedicated to it to pump water out into a lake, and then
19 the Navajo generating station again on the bottom here
20 with Lake Powell in the foreground with the station in
21 the back, and then the Palo Verde nuclear generating
22 station here which uses water here as well from the 91st
23 First Avenue treatment facility. So I am going to be
24 going through these. Please feel free to interrupt me
25 any time, ask for clarification or more detail to the

1 extent I can provide that.

2 And I will simply point out that Nobel laureate
3 Richard Smalley has identified these two concerns as in
4 the top ten for the next 50 years, water and energy.
5 And it is interesting that we have been talking about
6 energy and water but only in the last few years have we
7 been talking about water and energy together. So I
8 wanted to change that discussion a little bit and get
9 some emphasis on both of them together.

10 So they do tie together. It takes water to make
11 electricity and all kinds of other parts of the energy
12 cycle, not just electricity. And it takes energy to
13 produce water. Something like 20 percent, 25 percent or
14 more of energy in California is used, the electricity is
15 used just to move water around. And we use a
16 substantial amount of water here in water to move water
17 around. But I am not going to be talking about that. I
18 am going to be talking about the water costs of energy.

19 But one of the things I wanted to emphasize here
20 was that in terms of the water withdrawn, irrigation and
21 thermoelectric, power plants are now responsible for
22 approximately the same percentage of water withdrawn --
23 it is not the same thing as saying water consumed but it
24 is water withdrawn -- so that we are now on parity. In
25 fact, since this was prepared, I believe that

1 thermoelectric now exceeds irrigation in this country,
2 again, water withdrawn, not necessarily evaporated. But
3 it shows you the trend is going to be more and more that
4 power plants use more water than any other -- require
5 dedication of any water than any other use in the
6 country.

7 Just to list these people, many people helped to
8 put the data together. It was supported by the Arizona
9 Water Institute, particularly Scott Kelly, the first one
10 named there. He was my research assistant at the time
11 and has gone off to better things than working as a
12 teaching assistance, research assistant for me. But he
13 actually did his master's thesis on water and energy
14 nexus for the entire Colorado River watershed, which is
15 another interesting study. My study is just the State
16 of Arizona.

17 Now, when I talk about water in Arizona, we have
18 this kind of tourist impression of Arizona, the tallest
19 fountain in the world, several golf courses that you
20 probably have seen, water everywhere. So I was thinking
21 how can we kind of humorously look at the two things
22 Arizona might be known for, probably water use and the
23 military opportunities that we have in this state. And
24 here is what I have come up. This is jet waterskiing;
25 it is a famous water activity in Arizona. That was just

1 to emphasize the sense that a lot people think we are
2 not really in the desert that we are in. In fact, we
3 are.

4 So I am going to talk about these six topics.
5 And when we get to the end of this, we will talk about
6 some policy implications, at least from my view. It
7 will be up to you, of course, to decide whether they are
8 useful policies. But I want to talk about population
9 growth and electrical generation consumption; a bit
10 about the cooling water by source, where it is coming
11 from; the water consumption by fuel, that is each fuel
12 uses different amounts of water; and then the transfer
13 of water in and out of Arizona; and the last, policy
14 recommendations.

15 So let's first look at the population growth.
16 Here is a diagram which shows the anticipated growth
17 rate in Arizona, the speed and location of it, at any
18 rate, over the years. Everybody knows that Phoenix and
19 Tucson are growing, almost going to mesh sooner or later
20 so that Commissioner Newman, in fact, will have his
21 commute reduced as these cities merge here.

22 COM. NEWMAN: Hopefully with rail.

23 MR. PASQUALETTI: The population and the energy
24 demand go up in lockstep to one another. These are data
25 that are provided by a variety of the energy companies

1 around. But the blue line is population and the columns
2 are megawatt hours consumed. So we are, in fact,
3 increasing our energy consumption and we increase it as
4 the population goes up.

5 And APS, and there are a variety of even newer
6 numbers on this, but there is an anticipated substantial
7 increase need for both APS, SRP, TEP and the
8 cooperatives. All of them anticipate that they are
9 going to need a substantial increase in the generated
10 capacity. All of that increase, minus some of the
11 renewables, are going to require additional water
12 supplies.

13 Right now the water is supplied half by
14 groundwater and half from the Gila and Colorado River
15 supplies. And that's it, especially if you are talking
16 about Phoenix. Phoenix is actually a pretty well
17 watered place for being in a desert. Tucson is another
18 story. But we have water that we are pumping, that of
19 course takes energy, and water that we are pumping out
20 of the Colorado River in the neighborhood of 3,000 to
21 3,500 kilowatt hours per acre foot down to Tucson. So
22 it is not an insignificant amount of electricity that we
23 are using just to pump the water around the state.

24 But I want to point out that there has been some
25 reduction in the water use. This is from 1980 to 2000.

1 There has been some reduction in water use. And that is
2 even with the population increase. Now, the reason for
3 that in part, or two reasons, one is that we are
4 transferring water from our agriculture to a municipal
5 use and our industrial use. This is one way we can get
6 more water. We can transfer it from the uses that we
7 now have.

8 CHMN. MAYES: Dr. Pasqualetti, but going back to
9 the slide before this one, 13, was that all water uses,
10 Arizona, all water uses in Arizona, or just electric?
11 Is that both electric and other purposes?

12 MR. PASQUALETTI: As I understand, the total
13 amount of water used, not just for electricity.

14 CHMN. MAYES: Okay, got it.

15 MR. PASQUALETTI: Now, what is happening, the
16 population is going up but per capita use of water is
17 going down. This is a good sign obviously people paying
18 attention. We are using water more effectively, we are
19 using drip irrigation sometimes, we are curtailing
20 needless use of water, taking our turf out and putting
21 in desert landscape. We are doing a variety of things.
22 So the trend per capita is good. But, in fact, we have,
23 we just have more per capita so more people who are
24 requiring that water.

25 So the water situation is that we have got a

1 certain amount of water. We are not going to make any
2 more water from the existing sources. I mean there are
3 sources beneath us that are rather briny that we could
4 perhaps use in some ways, but for all intents and
5 purposes, the way we are going to get more water is we
6 are going to have to use it more effectively and more
7 efficiently, not that we are going to get more absolute
8 amounts of water.

9 So let's look at the electrical generation and
10 consumption here. Arizona power plants, you all know,
11 certainly on the Commission know, where these power
12 plants are. Coal power plants tend to be on the
13 peripheries, partly because the coal is there and partly
14 because the air pollution requirements of combusting
15 coal. Navajo generating station is in fact the only
16 generating station in the state that actually uses
17 energy fuel from the state, if you think about. All
18 these other sources use energy from someplace else.

19 And then, so we are getting electricity from the
20 Navajo generating station, which of course is way up
21 here near Page and the San Juan and Four Corners, and
22 farther up into Colorado, the Craig and Hayden plants.
23 And then there are a variety of other coal burning
24 plants. That's the black symbol here. There is a lot
25 of closer plants. And these closer plants are mostly

1 natural gas plants and usually combined cycle plants
2 because of their efficiency. This is a very nice
3 technical move, that is that these combined cycle
4 plants, being more efficient, use less water per
5 megawatt hour. And several of those have been
6 constructed now, the Panda plant near Gila Bend,
7 certainly the Kyrene retrofitted, and many others. So
8 this is actually a good move from a technical standpoint
9 and water standpoint.

10 But we still have this import and export of
11 electricity. This is where it gets kind of interesting
12 for people. They are saying why do we import and
13 export, why don't we generate all we need. Well, there
14 is a lot of parts to that question. And it has to do
15 with where do you get the energy, what is the cost, what
16 does it cost to export, what does it cost to import. By
17 the time you look at it all, we are importing a certain
18 amount of our electricity. We use about 75 million
19 megawatt hours a year, and we produce that in state,
20 about 84 percent of it in state. We get the rest of it
21 from Colorado. We get it from New Mexico, some from
22 California, but mostly that import electricity comes
23 from New Mexico.

24 CHMN. MAYES: Commissioner Newman.

25 COM. NEWMAN: I really didn't want to break in,

1 because I know this is -- you have a lot to teach us.

2 But on this import/export question --

3 MR. PASQUALETTI: Yes.

4 COM. NEWMAN: -- it is complex. And I think
5 some of your studies are the first time I learned about
6 that dynamic of import and export.

7 And do you have a monetization of that import
8 and export, or do you just have percentages?

9 MR. PASQUALETTI: Chairman Mayes, Commissioner
10 Newman, I don't really have a monetization. And there
11 are people in this audience who probably can address
12 that question. I don't know exactly how much it is.
13 You can kind of make a rough estimate.

14 COM. NEWMAN: And I made rough estimates and I
15 am just not sure whether they are accurate or not. But
16 it is very telling when you tell the story to laypeople
17 out there that we have the largest nuclear power station
18 in the country and that we do make our own power but we
19 are on sort of a negative trade deficit, if you would,
20 on the amount of money that goes out as goes in. And I
21 just wondered whether that has any relevance toward this
22 monetization of externality discussion.

23 MR. PASQUALETTI: The externalities, I can't
24 tell you the specifics about the cost; although, we can
25 certainly make back of the envelope calculations, and

1 certainly utility companies can answer that more
2 specifically than I can, because I am really focusing
3 more on the water.

4 COM. NEWMAN: Okay. Thank you.

5 MR. PASQUALETTI: Sure. Thank you.

6 So we are importing but we are also exporting.
7 And, again, we export for a variety of reasons. We have
8 contractual obligations to export. A lot of it goes to
9 California from Palo Verde, and Texas from Palo Verde,
10 and other states. So we are exporting -- we are
11 producing 105 million megawatt hours and we are
12 exporting maybe 29 percent of that to other states.
13 Again, these are, these are exports and imports that are
14 a result of the financial conditions and the
15 availability and the transmission requirements and the
16 availability of transmission capacity to move it back
17 and forth. So it is a very interesting and complex
18 topic.

19 But when we do that, as we are going to see, we
20 are importing and exporting water as well. So here is
21 where the electricity goes. This is just an average for
22 five years. But California gets more than any other
23 state, several other states get it as well, and that
24 California is a very big market. And a lot of reasons
25 why California needs that electricity, why they are

1 getting it from Arizona, is the higher price of that
2 electricity in California, variety of other reasons that
3 they use that.

4 Now, what the net is then is this, minus about
5 16 million megawatt hours, so import about 31 million,
6 we are expecting about 14 or 15 million, so the net is
7 we are exporting about 16 million. Now, when we are
8 doing that export of electricity, we are exporting
9 water, too. And we will get to that in just a second.

10 So, first, cooling water by source, this rather
11 complex table, which I will make more clear in a second,
12 simply illustrates the four sources that we have for
13 water: groundwater in the first column; surface water
14 for non-hydro in the second; surface water, hydro, in
15 the third; effluent and the reclaimed water in the
16 fourth. And the colors there, the orange color means
17 natural gas and the blue is hydro and the gray is coal.

18 But if you look at this, what you find is that
19 we get more water for electricity manufacture or power
20 generation, we get more water from groundwater than we
21 get from any other source. So we are taking
22 groundwater. In fact, some of the power plants, like
23 the Coronado power plant and Springerville power plant,
24 were largely put there because there was a great water
25 source there. There is a lot of water in their aquifer.

1 But we are getting more of our water from groundwater
2 than any other source.

3 So what is the water consumption by fuel? Here
4 is what is interesting, that coal uses more than half
5 the water. So we are generating electricity and more
6 than half of that electricity is being produced from
7 coal, and that is the water, rather, is going to power
8 plants more than any other source. So that 62 million
9 in this case acre feet -- 62,000 acre feet of water in
10 this case, coal is responsible for that use.

11 Now, this is, this table requires a little bit
12 of attention. And I will walk you through it from the
13 left to right. This represents the gallons per megawatt
14 hour of power produced. Nuclear uses the most, about
15 785 gallons per megawatt hours. These were numbers that
16 were gleaned from data provided by the utility companies
17 verified with data from the U.S. Energy Information
18 Administration and with the FERC, and then again checked
19 with the individual power plants. So we are pretty
20 confident about the numbers themselves.

21 So nuclear uses the most because nuclear has the
22 lowest thermal efficiency of these power plants,
23 operating somewhere around 32 or 33 percent efficiency.
24 Then when you get to coal, it uses less water per
25 megawatt but still 510 gallons per megawatt hour, and

1 then natural gas even less. Then there is a little
2 landfill; a little biofuel; we will get to solar thermal
3 in a minute; and then natural gas combined cycle even
4 less, which is one of the good reasons that combined
5 cycle is so effective around here; and geothermal, at
6 least the power plant that was operating when we did the
7 study, not very much; and solar PV much less than one
8 gallon per megawatt hour.

9 COM. PIERCE: Are these all Arizona figures?

10 MR. PASQUALETTI: They are all Arizona figures,
11 just Arizona, just the power plants that supply Arizona.

12 COM. PIERCE: Thank you.

13 MR. PASQUALETTI: Now, the numbers that are the
14 most interesting I think are, and here is solar thermal,
15 because this is getting a lot of attention, we took the
16 numbers provided to us and checked them with APS for the
17 facility, the one megawatt facility near at the Saguaro
18 power plant near Tucson. This is a rather unusual power
19 plant because of the engineering involved. So what we
20 did is, because it was just one megawatt, one example --
21 we did two things -- we first looked at the engineering
22 assessment for the Solana power plant which has been
23 proposed near Gila Bend and we looked at the Kramer
24 Junction concentrated solar power facilities in
25 California. And they average out around 900 gallons per

1 megawatt hour. And this means that the solar thermal is
2 using more than any other source, which is an
3 interesting finding. And we are going to talk more
4 about that in a few minutes.

5 Here is the embedded water transfers. Now, I
6 talk about this as embedded water. Sometimes people
7 talk about it as virtual water. Now, it is useful to
8 give a little background here. If you grow cotton in
9 Arizona and you export out of the state, you are
10 exporting water in the cotton, the same thing with
11 alfalfa. But you are also doing it with energy. So if
12 you are making electricity, you are condensing -- you
13 are cooling your condenser with water. You are going to
14 be using that water to make electricity. So in a real
15 sense you are sending that water around embodied in the
16 electricity as virtual water. So I want to talk about
17 that a little bit.

18 So here again, to review, we are bringing in a
19 certain amount of energy from out of state and we are
20 exporting a certain amount of energy to other states.
21 And when you do the numbers here, and to do these
22 numbers what you have to know is how much water is used
23 to generate each megawatt hour of electricity and what
24 is the percentage of that megawatt hour that comes from
25 each of the fuels, so the nuclear is more and coal is

1 less and combined cycle is less, so if you do all of
2 those calculations, what you find is that, in rough
3 numbers, about 30,000 acre feet of water is exported
4 from Arizona. That is, 30,000 acre feet of water is the
5 net amount. We import some in our electricity, we
6 export some in our electricity, but the net is that we
7 are sending, about 30,000 acre feet out.

8 COM. NEWMAN: Madam Chair.

9 CHMN. MAYES: Commissioner Newman.

10 COM. NEWMAN: I asked a former hydrologist this
11 morning about how much that is. I know that's a number.
12 Can you give me a physical application of that?

13 MR. PASQUALETTI: Sure, Madam Chair,
14 Commissioner Newman. There are a variety of numbers
15 floating around. Sometimes people say one acre foot per
16 household. You could probably do better. You could
17 probably do half an acre foot per household. If each
18 has a couple people in it, we are talking more or less
19 the population of Tempe in terms of the water that we
20 are exporting.

21 COM. NEWMAN: Thank you.

22 CHMN. MAYES: So, Professor, so our net water
23 consumption, is it the inverse of that, so we are
24 actually exporting 29,000 acre feet? It is a more
25 complicated explanation than that, but I do notice very

1 different figures for California and New Mexico. As for
2 Arizona it would appear that we are by far the most, to
3 put a positive spin on it, neighborly state in the
4 region in terms of providing power to our neighbors.

5 MR. PASQUALETTI: Well, Madam Chair, yes,
6 indeed. But you can see the numbers. Plus we are
7 sending it a little bit to Colorado. We are sending a
8 little, we are sending some to New Mexico. We are
9 sending some to Texas and some to California. So, yes,
10 we are doing, we are sending -- well, we are sending
11 most of our electricity, of the exported electricity, to
12 California. So, therefore, we are sending most of the
13 water to California as well.

14 Now, here is the part which becomes kind of
15 interesting, and it gets us into discussion of renewable
16 energy, which is part and parcel of all this I think
17 anyway. Just to give you some idea, there are cooling
18 technologies around, dry cooling technologies. These
19 data are taken from the Silverhawk power plant that was
20 partly owned by APS one time, no longer, but
21 nevertheless provides you some data. And indeed this is
22 a power plant that is a thermal electric power plant
23 that requires water. Over here, the normalized water
24 consumption in gallons per megawatt is 17 or 16.
25 Remember that the ones for nuclear were 785 or so and

1 coal was 510. So this is well over a magnitude less
2 water if you use dry cooling.

3 In other words, there are technologies for doing
4 this. You can put dry cooling technologies on the
5 existing power plants. But you have two penalties for
6 that. One, it costs you more to build these power
7 plants. And, two, the power plant efficiency is
8 somewhat reduced. So you do pay two penalties, and
9 eventually that ends up in being paid for by somebody.

10 This, to give you a sense of dry cooling cost
11 increments, here is once through in terms of capital
12 costs. And you can just look at, rather than the
13 numbers on the vertical axis, here you just see that
14 once through, which is a cooling technology that Cholla
15 power plant and Four Corners power plant uses, and wet
16 cooling system, which would be used by a variety of
17 other power plants including Palo Verde, and then the
18 dry cooling system. And, you know, you can see the
19 capital cost substantially higher. So you will have to
20 pay more for these power plants and there will be a
21 reduction in the efficiency of the operation of the
22 power plant as well.

23 So here is another what I find an interesting
24 topic. And that is the merchant plants and unregulated
25 plants. These plants, a lot of them have been moved

1 into Arizona recently. And they move into Arizona, they
2 use the water from Arizona, but they oftentimes export
3 their electricity to another state, primarily
4 California, in part because California's rates are
5 higher.

6 So do merchant plants provide enough of a return
7 to compensate for the water they use and export it?
8 This is a question I have asked, is that an adequate
9 compensation, are they being, are they being requested
10 or forced in one way or another to compensate for loss
11 of water. Because you are taking water out of the
12 ground in most cases here. You are passing through your
13 condensers. You are evaporating that water.
14 Electricity is effectively sending it out of state. So
15 I don't know where that comes down, but I am just
16 raising that as a point for some discussion.

17 Importing electricity, if in fact this becomes a
18 problem, perhaps we should emphasize places where water
19 supply is not so critical. That is, put your power
20 plants where the water is in abundance. And this
21 presupposes, of course, that you have the transmission
22 capacity to bring it in. This is a big if, of course,
23 but this has actually been an idea that has been bandied
24 about in the Western Governors Association and many
25 other bodies, maybe we should be putting our power

1 plants farther away and bringing in the electricity and
2 using water that's more abundant in those places. But,
3 as they say, transmission is the key.

4 This gets us to renewable energy. And the
5 question that I would like to ask is how might the value
6 of saved water provide extra incentives in support of
7 developing renewable energy, including at the border
8 with Mexico. In addition to the study that I am
9 reporting on here from the Arizona Water Institute,
10 there was a second study, where we looked at the water
11 and energy nexus at the U.S. Mexico border. And some
12 very interesting results came out of that study, some of
13 which I will talk about here.

14 So wind power, geothermal power and solar from
15 left to right there. You have seen this 100 times. We
16 are the best state in terms of solar. There are places
17 in the United States like Death Valley and places in
18 Mohave that have more solar installation but none that,
19 as a state, have more per meter or square mile than
20 Arizona.

21 Yet in many ways we are the doughnut hole in the
22 solar scheme of things with surrounding states having a
23 lot more solar in many cases than we do, and many
24 places, such as New Jersey, having perhaps more than
25 Arizona, and cities like San Francisco having more than

1 Phoenix, which is an oddity to say the least. Having
2 grown up in San Francisco where I never saw the sun for
3 two or three months at a time, I can tell you that's an
4 oddity.

5 Now, we have actually taken some steps. We
6 have, for example, put a concentrated solar power
7 facility at a correctional facility, or politely called
8 a correctional facility, a prison, in northwest Phoenix.
9 And the goal that we should have is to get solar to be
10 used by people who are not incarcerated, by people in
11 fact like most of us. So that's the goal. And we have
12 been making a little progress.

13 This is one that looks similar. This is the one
14 at Saguaro, just a megawatt in size. I took my students
15 down there not long ago, very, very interesting. We
16 talked about such things as how much they get out. It
17 is an experiment facility, not meant to do a lot of
18 things that a commercial facility would do. But they do
19 wash these panels, they do wash them.

20 And then there is some, a proposal, of course,
21 to build the Solana generating station west here of Gila
22 Bend on land which I understand is either cotton or
23 alfalfa, which, just for numbers' sake, alfalfa uses
24 about six and a half acre feet of water per year and
25 cotton uses about four and a half acre feet of water.

1 And I will get to why that is important in a second. So
2 Solana is just one of dozens of proposed power plants,
3 solar plants in Arizona.

4 This is the type of power plant that would use
5 somewhere around 900 gallons per megawatt hour to
6 generate electricity.

7 And this is Kramer Junction there. Actually, of
8 course, they have machines and they wash these mirrors.
9 Clearly the mirrors get dusty and oftentimes they have
10 to use deionized water. So that's a little bit more of
11 an expense. And then it looks like they have a machine
12 here, but as I will show you in a second it is not
13 always a machine.

14 But let me point out here is dry cooling for
15 solar. You don't have to have, you know, the water use
16 for cooling. You can use dry cooling here. And then
17 you get down to 43 gallons a megawatt hour, again an
18 order magnitude less than other sources. Now it is not
19 900 gallons, it is 43 gallons. Now we are talking
20 something that's quite reasonable. And there are dry
21 cooling technologies around that can be used for solar.
22 But, again, you are going to pay a penalty in efficiency
23 and in cost.

24 This is provided by SES, but the idea is that
25 all solar is not the same when it comes to water. So

1 there is a lot of discussion and I have heard it on
2 television and NPR. I have listened to various elected
3 officials in this state talking about how much water
4 solar takes. But not all solar takes the same amount of
5 water. And SES has put this together, and they say it
6 will take somewhere in the neighborhood of 22 acre feet
7 a year for a 500 megawatt plant. Well, I will give you
8 the real numbers in a second.

9 Air cooled power tower, air cooled geothermal,
10 air cooled coal fire, so forth and so on. Here is water
11 cooled parabolic trough, that's the kind at Saguaro.
12 This is of course SES's diagram and I cannot tell you
13 that I know if this is absolutely accurate, but I offer
14 that as some example, as an exhibit here.

15 There are some types of solar power facilities
16 that do not use water. And here is the largest in the
17 state, around a five megawatt facility around
18 Springerville power plant. This is constructed on land
19 owned by Tucson Electric Power. And it is a very large
20 array. Looking at it on the ground it looks like this.
21 And they are doing it for a variety of reasons.

22 They have a variety of panels in here. They
23 have thin film. They have all kinds of different panels
24 in here. They are all monitored. They are testing. It
25 is a very large array. It is one of the largest arrays

1 in the world. And it goes on and on. And people come
2 out here and they trim the weeds, which are the real
3 problem, in between.

4 And some people would say you don't ever have to
5 use water. I have asked several people I know who have
6 facilities like this, people who have 30, 40 years
7 experience with photovoltaic. They say they never wash
8 their photovoltaics ever. I have got them on my roof.
9 I have never washed them ever. Maybe occasionally, if
10 it hasn't rained for a couple months, I wash them, just
11 spray them off, but maybe twice to three times a year.

12 And we have also moved forward in terms of ASU.
13 We have got two megawatts now solar out there. These
14 are tracking, single axis tracking on the top of parking
15 structures. They are going to hopefully install, I
16 heard this morning, up to eight more in phase two and
17 another three after that in phase three.

18 And, of course, you can put solar on your roof.
19 This is, as in an area where you have got homeowners
20 associations, they won't allow you to tilt them
21 sometimes, so this is flat. It is not the optimum, of
22 course. On another house, we can see them on the roof.
23 Here they are tilted to about 20 degrees. And this
24 particular house they provide, this is 4.3 kilowatts, it
25 provides 40 percent of the electricity of that house.

1 It is absolutely silent. It is seamless. It takes
2 absolutely no water.

3 Now, I was invited to go out to Maricopa Solar
4 the other day. It is in Peoria, 75th and Northern, next
5 to the Agua Fria plant. And this is the SES SunCatcher
6 system, Stirling Systems. And this is what they look
7 like. Some of you perhaps have been out there.

8 Now, ostensibly these use very, very little
9 water. They don't use water in the cycle itself because
10 they are operating a Stirling engine. And they
11 concentrate the sun's energy on that Stirling engine.
12 The pistons go up and down and generate electricity. It
13 is a nice system. It has taken them a long time to get
14 this launched but they have had some nice investments
15 recently and they are breaking ground on the first phase
16 of an 800 megawatt facility west of El Centro, again an
17 area that doesn't have a lot of water, in Imperial
18 County.

19 Now, they do have to wash them. Here is the --
20 they have kind of a cherry picker. You can see the
21 people up there on the side washing them. This is their
22 greatest O&M expense there, is washing these mirrors.
23 And they have to use deionized water, again, so they
24 don't get any deposits on the mirrors themselves.

25 And just to give you a sense, here is the dirty

1 one on the left and cleaner one on the right. It does
2 diminish enough so it is cost effective for them to go
3 out and wash them. It does diminish their productivity.
4 Now, that's a small facility, a megawatt and a half out
5 there.

6 But if we look at -- here is I think, here is
7 what the SES, or Sierra, which is the company that's
8 doing the development, has in the pipeline here. Here
9 is the Imperial Valley one, they say about 750. Here is
10 one near Calico Hills to the east of Borosolvay, 850.
11 Here is the one and a half megawatt, the one out in
12 Maricopa. They are putting 850 down in Texas.

13 So one of their sales points is they don't need
14 water. You can argue about all sorts of other parts of
15 that.

16 Here are power plants that have been discussed
17 to be put in coming up in the near future, one to the
18 east of Tucson, others near Silver City in New Mexico,
19 others up in Colorado. So there is a variety of them.
20 In other words, they have finally got themselves
21 launched.

22 When I was chair of the Arizona Solar Advisory
23 Council, I had two members on that council, one member
24 on that council from the SES, and they were not going
25 anywhere but now they are. And water is one of the

1 issues that they have taken into consideration as they
2 are moving forward.

3 Another, and people in the room here can talk
4 about this, if you would like to ask them, but
5 EnviroMission, I have talked with these people quite a
6 lot. We put proposals in to them to do work for them
7 out at ASU. This is the solar towers we publicized in
8 the Arizona Republic. This is a tall tower of thousands
9 of feet. But the idea is that you would get a natural
10 movement upward of hot air and that would create a low
11 pressure in the middle here and pull in or induce in air
12 from the sides of this brass mile-wide array of
13 translucent, transparent surface material. And that,
14 with that air, as it passes by these turbines, would
15 turn the turbines and generate electricity. It is kind
16 of like the greenhouse effect with a chimney on it.

17 Now, this also doesn't use any water. Again, it
18 is something that EnviroMission has used to discuss
19 where they, where they can put them and where they are,
20 where they can get any water that they need. But they
21 are not going to need much of any water to do it. There
22 may be other obstacles here but it is not going to be
23 water.

24 Now, just to take you into Mexico a little bit,
25 the solar map that I showed you for the United States

1 just extends into Mexico. Clearly the border doesn't
2 stop the sun. The amount of energy there in
3 northwestern Mexico and Baja and in Sonora, Sinaloa,
4 neighboring states is substantial. And Mexico is a bit
5 farther ahead of us in some ways in the way that they
6 want to combine water and energy there.

7 One of the ways that they are considering doing
8 it is using a variety of solar techniques to
9 desalination facilities. There are many ways to desalt
10 water. Not all of them are going to be appropriate for
11 solar. But one of the ways you can do it is make
12 electricity and do a reverse osmosis. But there are
13 other ways, too.

14 But you also don't have to take that water from
15 nonpotable up to potable. You can take it from brine up
16 to agricultural standard, for example, and then release
17 some of the water that you are reusing for agriculture
18 to the municipalities. So you can do that. Mexico, and
19 particularly the University of Mexico, UNAM in Mexico
20 City where I was visiting last June, they are pretty far
21 along on this. And they have some technologies that can
22 do this.

23 This is something presumably we should be
24 looking at even more. And I certainly talk to people in
25 the state, state agencies about this, and that has

1 gotten some attention. And there are a variety of ways
2 to do this.

3 There are other ways, I might add, and I don't
4 have here on slides, that use algae both to sequester
5 carbon, which is one way to do it, and also to produce
6 energy without the use of any kind of water, even if it
7 is brine water.

8 CHMN. MAYES: Professor Pasqualetti,
9 Commissioner Stump raised this issue earlier today. And
10 I was, I appreciate him raising it and you talking about
11 it. So is it being explored anywhere besides Mexico,
12 for instance, in California? And then I guess it would
13 be interesting to hear from the utilities later on what
14 they know about the technology.

15 MR. PASQUALETTI: Madam Chair, yes, it is being
16 explored in many places. Certainly the Middle East is
17 exploring it. Substantially, I think all the utilities
18 are well aware of the potential here. It is usually a
19 cost problem. California is certainly looking at this.
20 California Energy Commission has looked at this in some
21 substantial detail.

22 Again the interest would be close to the border,
23 Imperial County, perhaps Riverside County in California.
24 So these are possibilities. And part of it has to do
25 with what is the present cost of water, what is the

1 present cost of energy.

2 One of the reasons that people say that we
3 haven't moved faster on solar here is because your
4 conventional energy sources are fairly inexpensive,
5 especially compared to California. That is the reason
6 they sell in California. So there are possibilities in
7 a variety of states. That is certainly something that
8 everybody is looking at. There are journal articles
9 about this, quite a number of them in fact, that can
10 give you substantial amount of detail. And I am sure
11 somebody here in the audience can talk about that as
12 well.

13 CHMN. MAYES: Commissioner Stump.

14 COM. STUMP: Thanks, Madam Chair.

15 Just to that point, Professor, I guess part of
16 the problem, which I think you sort of hinted at, is
17 that according to a Pacific Institute study that I was
18 looking at earlier, the energy use accounts for about
19 one third to one half of the cost of the produced water.
20 And so the supply is thereby vulnerable to changing
21 electricity prices. And the Pacific Institute, at least
22 in their opinion, they felt that including the cost of
23 producing the desalinated water is unlikely to drop, at
24 least in the short term, below about \$980 per acre feet.
25 I would be curious to know if you agree with their

1 assessment in those two respects.

2 MR. PASQUALETTI: Madam Chair, Commissioner
3 Stump, I have seen those numbers. And I have also seen
4 numbers that are at least an order of magnitude less
5 than that. So I would suggest that that might be
6 something to look into in more depth. I know that Peter
7 Gleick at that institute certainly has discussed this
8 sort of cost range.

9 But it is less than that. I mean I can tell you
10 from my own research, and I am not an expert in this so
11 I can just tell you what I have read, it is on an order
12 of magnitude less than that. So you can -- there are
13 articles. We can find them for you if you are --

14 COM. STUMP: Thanks.

15 CHMN. MAYES: Commissioner Newman.

16 COM. NEWMAN: To this point as well, and I would
17 like to hear from anyone in the room that may know more,
18 it is really interesting how you said that, you know,
19 these are all matters of cost/benefit. You know, we
20 have, we probably have the knowledge to do it. And it
21 is about numbers.

22 But the question is if climate change changes
23 North American climate and, you know, we may have to be
24 doing this kind of thing lickity split, and not
25 necessarily on the coast because the coast can be

1 inundated with water as well, so it maybe puts Arizona
2 in a unique position to be a leader in this sense. And
3 certainly I think somebody should be looking at it. And
4 I am not talking about ten years from now, but certainly
5 within the next, you know, several decades.

6 What is your comment on that?

7 MR. PASQUALETTI: Chairman Mayes, Commissioner
8 Newman, I have talked with people at DWR here in the
9 state certainly. They are certainly aware of this.
10 They think it is a possibility. There are people
11 researching it, talking about it.

12 I went down recently with some people to the
13 desalination facilities near Yuma. That is -- they are
14 starting that up again. There is a lot of, there is a
15 lot of possible ways to do this. For example, if you,
16 if you -- well, we can do it here. We can desalt here
17 in Arizona, or you can go to San Diego for example and
18 they can have desalting facilities along the coast.

19 COM. NEWMAN: I think they are looking at it,
20 from what I understand.

21 MR. PASQUALETTI: I think they are. And that
22 releases water back up the Colorado River which we can
23 then tap. So there are ways we can do it directly or
24 indirectly. But clearly there are pools of briny water
25 in many of the basins in Arizona that could be utilized

1 for the purposes of desalination.

2 The use of algae, for example, algae can be
3 grown in salty water. You can produce fuel out of it.
4 It is a substantial other area that we didn't look at in
5 the study but I have since come to appreciate as a
6 possibility.

7 COM. NEWMAN: Thank you.

8 MR. PASQUALETTI: So here is just a summary and
9 conclusions. And then I would be happy to take any
10 questions.

11 The idea of virtual water, export water when we
12 export electricity, I think it is an important concept
13 to keep in mind. It is not to say we don't export with
14 other things. We do with crops. We send our cotton
15 abroad. We do all sorts of things. But it is something
16 to think about, because when you are, when you are
17 growing crops, you are including the water cost in the
18 cost of that crop. The question would be, when you are
19 making electricity, are you including an adequate cost
20 of that electricity in the cost of your electricity, the
21 cost of the water in that electricity. I don't know if
22 that's true.

23 COM. NEWMAN: I think we do.

24 MR. PASQUALETTI: I don't know if that's true or
25 not and certainly it is worthy of more detailed study of

1 this.

2 COM. NEWMAN: Interesting.

3 MR. PASQUALETTI: Technology, I think the
4 technology is available. We can do dry cooling with
5 conventional, dry cooling with solar. We can do a
6 variety of ways to cool these power plants and use much
7 less water. But, as I said, there will be at least two
8 penalties that you will have to pay.

9 Merchant plants, the question I raised before,
10 is the question of net benefit. When you add in
11 everything, I have never seen a cost/benefit analysis
12 with these merchant plans. Certainly they provide tax
13 money, they provide jobs, they do a whole variety of
14 things. Do they do enough to compensate for the water
15 loss, that's another question.

16 And then renewable energy, there are some
17 encouraging advantages. Solar, concentrating solar
18 power certainly will use a fair amount of water. As I
19 said, there will be ways to make that dry system, but
20 that will have to come after they make sure they can do
21 all this economically without the dry system in Arizona.

22 So, but what I am thinking is, and this is an
23 interesting kind of comparison, is that if you take the
24 first stage of solar in this state, I don't think there
25 is going to be a problem because the first stage of

1 solar -- like the Solana plant is going to be on land
2 that's in alfalfa. Now you are going to take the
3 alfalfa out of production and put solar in production.
4 You are going to save about 80 percent of the water. So
5 what is going to happen I think in the first phase, from
6 a policy perspective, is to allow the solar power people
7 to go on land that already has the water associated with
8 it, remove that from agriculture and dedicate it to
9 solar, saving about 80 percent of the water in the
10 process. That way you get the electricity, probably
11 make more money off the electricity, and use one fifth
12 the water.

13 COM. NEWMAN: Just a quick --

14 CHMN. MAYES: Well, let's have him wrap up and
15 then we will start with questions.

16 COM. NEWMAN: Okay.

17 MR. PASQUALETTI: Then the subsequent stage, I
18 think that there is a potential problem. Then third, PV
19 solar is favored because of its low water use. And
20 there is a very strong interest in photovoltaics of
21 course. The CSP -- of the 30 plants that I saw that
22 were on BLM land proposed in Arizona, I think only one
23 or two were photovoltaics. Most of them were CSP.

24 So when we get to the point where it is cost
25 effective, and I think once we get to, this is key, this

1 is what I talk to my students about at length, once we
2 get the external costs internalized in the rate base for
3 the conventional sources of energy, it is going to
4 narrow the cost gap between renewable and convention.
5 Right now there is a big gap, or there is a substantial
6 gap. But if you can, in fact, include a value for the
7 water not used, and if you include the external costs
8 for the other that solar does not have, you narrow that
9 gap to where you are within striking distance. And
10 that's something that I think is worth pursuing as well.
11 And then emphasizing the external costs I think will
12 favor water, sorry, would favor solar because, in fact,
13 solar has so few of these.

14 Some people would say that it takes up a lot of
15 land. I have done studies which some would argue that's
16 not the case. And we can talk about that if you would
17 like. And solar desalination can improve water supplies
18 and they can improve them in stages. You don't have to
19 bring it from the worst water to the best water. You
20 can improve the water to agricultural quality and the
21 agriculture water to drinkable water.

22 So with that, I would like to close. And I
23 would be happy to answer any questions. And if you have
24 any time or you would like to hear from Professor
25 Ruddell, he can speak to you about water and the urban

1 heat island as well.

2 CHMN. MAYES: Thanks, Dr. Pasqualetti.

3 Commissioner Newman.

4 COM. NEWMAN: Yes, a couple questions. Well, on
5 the issue of, and I certainly agree with you that
6 building this solar facility on, or for that matter any
7 power facility, on agricultural land makes sense. But
8 this is the -- because I have been dealing with this for
9 a number of years as a supervisor and now as a
10 Commissioner, some of that land is not being used at all
11 either because of, you know, government programs for
12 subsidization or just because we don't need as much
13 alfalfa. And so, you know, what do you do about that?

14 I am asking a strange question. Retired
15 agricultural lands that will never become agricultural
16 land again, we have so much dedicated to it, is it
17 really a savings if that piece of land has just been
18 sitting out there waiting to become the newest Buckeye?

19 MR. PASQUALETTI: Commissioner Newman, there is
20 multiple parts to that question. Oftentimes the
21 agricultural land has water rights associated with it,
22 so you could rededicate or repurpose those water rights
23 and release some of the water back. The people who have
24 the water rights usually use that water for something,
25 selling it, because it is so valued. So you could take

1 that out and repurpose that for something else.

2 But for the foreseeable future, there is so much
3 land that is being used for cotton, for alfalfa, I would
4 say that whole corridor from Gila Bend all the way to
5 Yuma, you could put solar in most of that, on a lot of
6 agricultural land, apart from all the political
7 ramifications of course of trying to do that. But there
8 is, there has been no shortage of landowners interested
9 in talking with solar developers. They certainly are
10 all aware that they can make money by selling that land
11 or even leasing that land and their water to solar
12 developers.

13 COM. NEWMAN: I talked to a lot of my ag
14 business friends, and there is a love/hate relationship
15 also. They are very, very -- how do I say it --
16 protective of that land, whether it is for future water
17 rights or cultural reasons, of keeping a strong
18 agriculture business economy or for economic reasons.
19 That has been my experience in trying to talk to my
20 fellow Arizonans who represent that business.

21 MR. PASQUALETTI: Chairman Mayes, Commissioner
22 Newman, I think that there is, there will always be some
23 pushback from some people. But the income that they can
24 generate from electricity will exceed, I think in most
25 cases, what they can make from their agriculture.

1 Moreover, the agricultural land is already disturbed
2 land. You don't run into a variety of endangered
3 species act problems. There is a permitting procedure
4 less arduous for land that has already been disturbed.
5 But there are a variety of other reasons for doing this.

6 There is a big temptation in Arizona because we
7 have 110,000 or so square miles and everybody says, gee,
8 there is plenty of land, why don't we put solar
9 everywhere. And then when you try to do it, people
10 decide there are reasons that they don't want to do
11 that.

12 I think we have actually turned that corner. I
13 have been waiting for years for this to happen. I have
14 been here since 1977, and every few years people say I
15 think we have turned the corner. But I think we might
16 have actually done that this time. I see people
17 spending serious money doing this. The business world
18 is saying this is a cost effective way of making
19 electricity.

20 Now, of course, there are incentives. There are
21 investment tax credits and so forth. But that won't
22 stay around for long. And I just see an enormous
23 enthusiasm for solar energy development in Arizona. And
24 one of the attributes of solar is, for the most part,
25 they don't use the water that other sources do.

1 Can you make enough solar electricity to offset
2 what you need from or get from another power plant,
3 that's another story. I mean clearly you could if you
4 want to cover enough land. Do you want to do that?

5 There are other ways to do this. I think that
6 there are ways to do infilling with solar that we
7 haven't taken advantage of. We could have many hundreds
8 of megawatts within the infilled area on existing
9 parcels in the Phoenix area. There are ways to do that.

10 COM. NEWMAN: I absolutely agree with you.

11 MR. PASQUALETTI: And I know that, I believe
12 that, if I understand and people may be able correct me,
13 I believe APS' demand is growing about 300 megawatts per
14 year. And that, I mean that's a big chunk. And if you
15 talk to other people, like Southwest Energy Efficiency
16 Project, they will tell you you can get that by energy
17 efficiency. And you certainly can do a lot of that sort
18 of thing. So there are alternatives besides going with
19 the same path. And I think, once you include the
20 external costs of going down the same path and you
21 include those costs, then the margin of difference in
22 the cost between renewables and nonrenewables is largely
23 eliminated.

24 COM. NEWMAN: The only other question I had, I
25 am just limiting it to one other question, there were

1 many questions that your presentation brings into mind,
2 but I thought I saw a graph. There was a presentation
3 earlier by APS that showed how much water was being used
4 in an ag business struck area. And it showed, it was a
5 big, big fat piece of the circle. And I invite my APS
6 people, friends to respond to this, but you said a
7 statement earlier and I am trying to think whether they
8 meshed, that 40 percent is used for energy and
9 40 percent for ag water. I think that's what you said.

10 And it seems -- I don't know if the, if the two
11 models mesh. And they don't mesh. I just picked it up.
12 And I just don't know why they are not meshing. And I
13 invite you to explain that, and APS.

14 MR. PASQUALETTI: Commissioner Newman, I can
15 explain that. The number of 40 percent is a national
16 figure, is a national figure.

17 COM. NEWMAN: Oh, I misheard you then.

18 MR. PASQUALETTI: The vast amount of water used
19 in the state is irrigation.

20 COM. NEWMAN: Okay.

21 MR. PASQUALETTI: It is very high.

22 CHMN. MAYES: 60 or 70 percent.

23 MR. PASQUALETTI: At least it is 40 percent. I
24 was just putting that up there to emphasize that
25 nationally it is becoming comparable for thermoelectric

1 power plants and for irrigated agriculture national. I
2 should have clarified it was national.

3 COM. NEWMAN: You may have said that; I just
4 missed the word. Thank you so much.

5 CHMN. MAYES: Okay. Commissioner Stump.

6 COM. STUMP: Thanks, Madam Chair.

7 Professor, I have I suppose what you might call
8 more of a meta question as it were. And again citing a
9 fellow at the Pacific Institute, Peter Gleick, he said
10 something that struck me. He said it is inevitable that
11 we will solve our water problems; the trick is how much
12 pain we can avoid on that path to where we want to be.
13 And he distinguishes between, I guess, degrees of pain,
14 hard path solutions and soft path solutions.

15 A hard path solution as he sees it involves
16 gaining new supplies of water, the super sized dams,
17 aqueducts, pipelines carrying water long distances. And
18 the soft path, which he sees as the more comprehensive
19 approach, involves things like better conservation
20 measures, better measures as they relate to efficiency,
21 improvement on community scale infrastructure,
22 management of watersheds, et cetera.

23 And he cites Albuquerque as an example of the
24 soft path approach. Until the mid 1980s,
25 hydrogeologists evidently believed that there was a

1 reservoir underneath the city as big as Lake Superior,
2 quote, unquote, and supreme lawns were ubiquitous. And
3 unfortunately they discovered that the aquifer was not
4 nearly as big as they had expected. And so water use
5 codes were instituted, rebates for low flow fixtures and
6 the like. And domestic per capita water use declined
7 from 140 gallons a day to 80.

8 And so I was curious, and maybe this is a false
9 dichotomy, but I wondered if you favor one approach over
10 the other, a combination of soft and hard, or both,
11 perhaps both are essential for Arizona to move forward.

12 MR. PASQUALETTI: Chairman Mayes, Commissioner
13 Stump, I actually favor the combined approach. I think
14 that they both can push one another. I am interested in
15 one pushing the other. That is, the soft approach is
16 nice.

17 If you look at it from the standpoint of
18 electricity, I think that electricity in the
19 conservation of electricity is different than the
20 efficiency of electricity. So I look at energy
21 efficiency as technical and conservation as behavioral.
22 You flip off the switches when you are going out, that's
23 conservation. The lights go off automatically, that's
24 efficiency. I just like to make that distinction.

25 But I think that's kind of the soft path and the

1 harder path. You can, I think, do both of those. I
2 have seen it happen in Las Vegas as well. I am sure
3 many of you have been to Las Vegas and you know how
4 aggressively they have been taking out turf there and
5 paying for taking out turf. I think Albuquerque is a
6 perfect example of moving in that direction. We can do
7 that as well. We can do that as well.

8 But there is some very nonsensical ways that we
9 use water. And all of you know these, I mean using the
10 same drinking quality water to wash our cars, wash down
11 our pavement. It is just a crazy system. And many
12 other countries don't do that. The first time I lived
13 in England, for example, people told me only drink water
14 out of the tap, out of the mains they call it, which is
15 the sink. All the rest of the water you shouldn't be
16 drinking in the house. So they had two different
17 supplies of water. We can do that, and we probably
18 should do that.

19 Mostly we can do that in a fast growing area
20 like Phoenix has normally been, we can do that in all
21 new housing structures. You put in codes, we are going
22 to have a separated system and we are not going to use
23 water that way. If you want to save water, that's
24 probably the fastest way to save it. But there will be
25 technical ways within that answer and there will be

1 behavioral ways within that answer.

2 COM. STUMP: And to that point, Madam Chair, the
3 idea of dual plumbing, and I don't know how widespread
4 that is, but as I understand, I understand there is one
5 line for potable water, another line to recycle the less
6 treated water for toilets and lawns and all the rest.
7 And I think Albuquerque was looking at that last I
8 heard. And I don't know how widespread that is or how
9 many municipalities and such are looking at that, but
10 interesting idea.

11 CHMN. MAYES: Yeah, and I agree with
12 Commissioner Stump about that. It is really fascinating
13 the way that you put that and/or, I guess, you know,
14 Peter Gleick puts that. And I appreciate you bringing
15 it up, Commissioner Stump. It sort of frames it in a, I
16 think, a different way. And I think it is, that's
17 valuable.

18 And, you know, dual plumbing I think is
19 something we ought to look at. It is purple pipe to the
20 home, purple pipe to the outside of the home, especially
21 in new construction. Only one of our water companies is
22 doing that, or even planning on doing it. None have
23 actually done it. And only one city, I think Tucson,
24 has done it. There is only a couple neighborhoods in
25 Tucson that have done it. But I think it ought to be

1 done everywhere, frankly, where there is new
2 construction. But that may be a discussion for another
3 day.

4 I just have a couple final questions,
5 Dr. Pasqualetti. One is you talked about using ag land
6 first. Well, let me ask you about this. We talked
7 about the IPPs. You posed an intriguing question. Are
8 the independent power providers, are we requiring enough
9 from them for the right to use our water and export
10 power for them to profit from exporting power primarily
11 to California?

12 Obviously there are some huge interstate
13 commerce issues there, and I don't want to -- we are not
14 at the law school right now. But I do -- it does pose
15 an interesting question for this Commission, which is
16 increasingly being asked to site and approve solar
17 plants that will largely be exporting power to
18 California because of its much larger renewable
19 portfolio standard.

20 As you know, California has a 33 percent
21 standard; Arizona has a 15 percent standard. And APS
22 doesn't really need to build any more large scale solar
23 plants or purchase power from any more large scale power
24 plants to meet their requirements under our current RPS,
25 which basically means that all these power plants, solar

1 power plants, that we are siting today will go to
2 California. They will be here. And if they are CSP,
3 they will use our water to export to California.

4 I philosophically have not necessarily been
5 opposed to that. I think there are all sorts of
6 benefits associated with having these projects here,
7 including the upfront jobs and the supply chain jobs
8 that might be attracted to Arizona as a result of that.
9 But how do you think -- you obviously think that there
10 ought to be some --

11 COM. NEWMAN: Value.

12 CHMN. MAYES: -- yes, I guess value extracted,
13 if you will, from the independent power producers that
14 are traditional natural gas, combined cycle plants. Do
15 you think the same should be said of solar plants? Is
16 there some demarcation between those two that makes them
17 different or --

18 MR. PASQUALETTI: Madam Chair, to me it is --
19 being at the university, I want to study these things
20 first. I would like to find out what it is that -- what
21 is that incremental cost associated with that, what is
22 that cost associated with this, both for conventional
23 and for solar. It is fair game. We are trying to level
24 a playing field here. But including external costs, we
25 are trying to level the playing field, should work in

1 both directions. And certainly what I would really want
2 to see, I just want to see this level playing field for
3 all.

4 If you, just as a point of argument, take out
5 the subsidies and all these various different systems,
6 whether it is coal subsidies or nuclear subsidies or
7 solar subsidies, and you level that field and then you
8 compare them, I would be very interested in seeing what
9 that would be like, especially once you include the
10 external costs, the visibility costs, the health costs,
11 health and transportation costs, a whole variety of
12 other, long-term waste disposal.

13 I worked on nuclear decommissioning for years
14 and saw nuclear waste disposals. And I know there are
15 huge costs right there that right now are not being
16 absorbed by all the companies. So it is -- and it goes
17 on for a very long time.

18 So I would like to level that field, compare
19 them all, and then see where we are.

20 CHMN. MAYES: Okay. Thank you, Dr. Pasqualetti.
21 And one last question, then we will take some comments
22 from your colleague. We appreciate him coming as well.

23 You mentioned ag land. Increasingly, as we site
24 these solar projects and as we site power lines, we do
25 both here, it seems to me that we ought to be thinking

1 about the siting of power plants with a view toward
2 where that ag land is, quite frankly, I mean just to get
3 to the bottom of it. At bottom, we know where a lot of
4 the ag land is. It is between Phoenix and Yuma and
5 between Phoenix and Blythe. And I am wondering -- and,
6 you know, we have existing power corridors in both of
7 those areas.

8 And so I wonder, have you given any thought to
9 that, about the siting of transmission near ag land? I
10 mean we talk a lot about siting transmission near where
11 solar projects have requested interconnection. But I am
12 wondering if we should even be taking a step further and
13 be driving that solar interconnection into these ag
14 areas.

15 Commissioner Pierce talked about it earlier
16 today. You have talked about it today, where we know,
17 you know, we know we want the phase one stuff to go
18 there. We know we ought to be exhausting the phase one
19 stuff before we, again, get to the phase two stuff,
20 which is where we are going to be getting so much
21 pushback from environmental people and BLM and Game &
22 Fish. So shouldn't we really be looking at power
23 corridors that really run through both the agriculture
24 and solar heartland of our state.

25 MR. PASQUALETTI: Madam Chair, I think the

1 Western Governors Association and many other
2 organizations have been looking at the placement of
3 transmission lines vis-a-vis the renewable energy
4 availability in the western states. I don't know that
5 they have been specifically calling out the agricultural
6 land as something that is of influence.

7 CHMN. MAYES: We haven't. I sit on the
8 committee. I go to all the meetings, many, many, many
9 meetings. And we are not. But I think we have the
10 opportunity to do that in Arizona because we have our
11 transmission planning processes. So any thoughts that
12 you might have on that would be obviously welcome.

13 MR. PASQUALETTI: Well, when I have some
14 thoughts I will certainly share them with you.

15 CHMN. MAYES: Okay, great. Sounds good.
16 Listen, why don't -- thank you very much for coming. We
17 really appreciate it.

18 MR. PASQUALETTI: Thank you very much.

19 CHMN. MAYES: And, particularly, I mean all the
20 slides were fascinating. And are those available on
21 ASU's website or is that something you can share?

22 MR. PASQUALETTI: They are on your desktop, and
23 you can take that if you would like.

24 CHMN. MAYES: Thank you very much, appreciate
25 that.

1 All right. And we are going to take about a
2 five- or ten-minute break right now.

3 (A recess ensued from 2:53 p.m. to 3:07 p.m.)

4 CHMN. MAYES: Let's come back into session. I
5 know it is getting late in the afternoon, but I think we
6 still have several Commissioners here and we have one
7 last individual to speak.

8 And I apologize that we are so late in the
9 afternoon but we would love to hear a few words from you
10 as well. And if you could, say your name for the
11 record.

12 MR. RUDDELL: Madam Chair, my name is Benjamin
13 Ruddell. I am on the engineering faculty at Arizona
14 State University. And my specialties where I do
15 research are water resources, ecohydrology, which is the
16 connection between water and plants on the landscape,
17 and also energy and water connections. So I am a
18 colleague of Dr. Pasqualetti, who just spoke. And I
19 would like to offer just a few minutes of remarks. I
20 don't have any slides for you. And I will be very brief
21 and to the point.

22 We have a unique opportunity in the Phoenix
23 metropolitan area not afforded to many places in the
24 world that have trouble with water energy issues in
25 terms of the need to use electricity to cool the city.

1 And that opportunity is the direct use of evaporative
2 cooling of water to reduce air temperatures and thereby
3 reduce the need to use and generate electricity for the
4 purposes of air conditioning.

5 Now, I will just say right up front some of what
6 I am going say is counterintuitive because we have
7 gotten used to, in the last 20 years, the notion of
8 saving water and reducing water use, and this being a
9 good thing, but I am going to suggest that there is some
10 research that has just been completed which may offer a
11 counterintuitive point, which is that you can use water
12 strategically in an urban area to actually save energy.
13 And you can possibly even save water by using more
14 water. Let me explain how that would work.

15 So there is a study that just came out, Gober,
16 et al., 2010, the Journal of American Planning
17 Association. She is a colleague of mine at Arizona
18 State University, the director of the Decision Center to
19 Desert City. And I spoke with her about this just
20 recently.

21 That paper demonstrates that, according to some
22 preliminary data that has been collected in the Phoenix
23 metro area and some modeling that has been done, when
24 you apply water to turf areas and to trees, you can
25 decrease the air temperature in the immediate vicinity

1 of that water application.

2 The principle is very simple and easily
3 understood. When you have solar energy or heat energy
4 and thermal energy coming in, and you have in the
5 atmosphere a deficit of water, in other words, you have
6 a relative humidity below 100 percent, if you put water
7 on a plant or on a surface of any kind, it will
8 evaporate. The evaporation of that water takes energy
9 out of the system and that's energy that doesn't go into
10 heating the air. So it is evaporative cooling, and the
11 more water you apply and the larger the green space, the
12 greater the effect.

13 So there is some research going on at ASU right
14 now which is aimed at demonstrating that effect and
15 quantifying it and actually trying to understand whether
16 this is an effect that can be scaled up. We all know
17 that standing under a tree where the tree is evaporating
18 water and shading us is going to cool us. But I think
19 the really interesting question and the one that we are
20 working on right now is the question of whether we can,
21 as a matter of public policy, manage green spaces
22 throughout the city, design and build them in and, in
23 fact, use water to cool the city's air temperatures
24 thereby reducing the need for air conditioning.

25 There is going to be a trade-off between green

1 space water use and between the cost of the electricity.
2 And we are not exactly sure what that trade-off is.
3 That's a very interesting question and one that hasn't
4 been answered yet. But this is an area that I would
5 like to suggest to the Commission, Madam Chair and
6 Commissioners, that should be taken into account in the
7 future and is something that's going to become
8 important.

9 Now, here is a connection to Dr. Pasqualetti's
10 work. I will just conclude with that. And it is
11 well-known that for the generation of electricity we
12 need lots of water. We just heard Dr. Pasqualetti give
13 an excellent presentation on that for about an hour. It
14 may even be possible, and this has not yet been
15 demonstrated, but it may in fact be possible to save
16 water for the city as a whole by using more in the urban
17 center for evaporative cooling and avoiding the use of
18 water to generate power or electricity at our thermal
19 generation stations. So that's a very interesting
20 question and one that may be on the horizon for public
21 policy.

22 CHMN. MAYES: Professor, thank you. It is an
23 intriguing, well, maybe provocative question that you
24 pose. But certainly it is something that I have thought
25 about from time to time as we, in many of our cases,

1 many of our water company cases, we talk about
2 encouraging -- in fact, we have measures that we
3 subsidize through our water companies that encourage
4 xeriscape, for instance. So we are trying to get rid of
5 the use of water for green things, I guess, for lack of
6 a better more scientific term. We are trying to get rid
7 of turf. We are trying to get rid of, you know, turf in
8 front and backyards, those types of things, certainly
9 golf courses.

10 And I guess, you know, one of the -- so is it
11 maybe not a zero sum game? Maybe it is not a question
12 of discouraging turf everywhere but rather encouraging
13 turf in strategic places? Is that the -- is that what
14 you are looking at?

15 MR. RUDELL: Madam Chair, yes, I believe that's
16 what the research is suggesting. And I think the most,
17 the key issue in the research is whether you can --
18 let's say if you have a house 100 yards from a public
19 green space that is being managed to cool urban air
20 temperatures. What is the private benefit and the
21 private reduction in electricity costs that is incurred
22 from that public management? And to what extent can
23 that actually be controlled by water companies, by
24 cities and towns, by utilities? That's the really
25 interesting point. And we really don't know yet.

1 CHMN. MAYES: How will you know? How do you
2 scale it up? Obviously you can't scale it entirely up
3 or else you are going to cause a lot of heartache to
4 a lot of people who probably aren't going to want you to
5 be running around putting turf in everywhere. How do
6 you test that from an academic standpoint.

7 MR. RUDELL: Right. That's a good question and
8 one I can talk about for hours, but I won't. I just
9 wrote two proposals on that.

10 CHMN. MAYES: Can we get credit for this? Go
11 ahead.

12 MR. RUDELL: As the number of federal funding
13 agencies have recently heard from myself and my
14 colleagues, you can test it through a combination of
15 techniques. You can use aircraft where you are flying
16 over the city and taking high resolution thermal
17 imagery. So you can see exactly what the pattern of air
18 temperatures is on the landscape. And then you can
19 compare that with evaporation patterns.

20 You can also do something a little more direct.
21 I am working on an experiment in the east valley where
22 in a large master planned community that has a lot of
23 turf and tree area, fairly typical of the valley's
24 communities, we are going to be measuring the water
25 application to the plants and turf directly and then

1 measuring humidity and temperature levels on transects
2 through the community. So we will be able to directly
3 measure the effect of water application in one location
4 to air temperatures and humidity levels throughout the
5 community and we will be able to directly model and
6 measure that effect.

7 CHMN. MAYES: I think from the context of what
8 you said I understand what transects are, but what are
9 transects?

10 MR. RUDELL: Yes. Transect is a technical term
11 for an experiment where you design a -- you would
12 measure, take measurements along a line or along a grid.
13 So I would take a temperature measurement in the middle
14 of the park and then I would take a temperature
15 measurement in someone's front yard a little bit away
16 from the park, and then a little bit further. And that
17 would allow me to separate out the effects of the
18 distance and the different land cover types. It is a
19 way to design experiments.

20 CHMN. MAYES: Commissioner Newman.

21 COM. NEWMAN: Yeah. Thank you, Madam Chair.

22 It is interesting and provocative, what you are
23 saying. A couple days ago on Monday morning I took a
24 walk over to Sabino Canyon down in Tucson. And the air
25 temperature probably out in the general area of midtown

1 Tucson where I was was around 80. And over in Sabino
2 Canyon it was probably around 65, especially close to
3 the water source that was coming down the creek in the
4 Sabino Creek. And not only did I find it exhilarating,
5 I found it lovely. And I said to myself, well, this is
6 what, you know, this is how God meant it to be in
7 Arizona, you know, when the water is running.

8 And it concerns me that around 80 percent of
9 these riparian areas had been destroyed in the last
10 100 years, a lot of them by the pioneers of Arizona,
11 some of whom were the power companies of Arizona and all
12 of the, you know, the planners that, quote, unquote,
13 planners who weren't really planning but just basically
14 developing what was in front of their faces, which is
15 understandable.

16 But so a natural sort of experiment of what you
17 are saying is look at a riparian area and how much
18 cooler and more delightful it is, is that correct?

19 MR. RUDDLELL: Yes, in brief, that is correct.

20 COM. NEWMAN: And so since I can't restore, you
21 know, those 80 percent of the riparian areas in Arizona
22 that have been restored, urban planners such as yourself
23 are saying we can't restore them either, maybe we can,
24 maybe we should, but we should also try to do something
25 with our urban planning and take some of the heat island

1 effect off of all of Phoenix and our two major urban
2 areas of Tucson and Phoenix by making us greener in that
3 inner core. Because when it gets red hot there when it
4 is 120, that has an effect all over on temperatures,
5 doesn't it?

6 MR. RUDDLELL: Yes, Commissioner, I would agree.

7 COM. NEWMAN: So what you are saying is not
8 necessarily, you know, anti-intuitive. It might
9 actually be very intuitive, like we are bringing back
10 many riparian environments through grass or turf in
11 places where people live now.

12 MR. RUDDLELL: Uh-huh.

13 COM. NEWMAN: We are ripping up the parking lots
14 and putting in greenbelts.

15 MR. RUDDLELL: Yes. I think there is some
16 interesting policy implication here. It is going to
17 take, I think it is going to take a little bit of time
18 for that idea to catch on.

19 COM. NEWMAN: I would say so. No, in terms of
20 planning, it will, because it is hard, it is hard to
21 have the leadership to do that.

22 Also, it occurs to me, I was always fascinated
23 with this, Salt River Project inundates whole areas of
24 this city and their surrounding areas with excess water
25 and they make like little lakes in people's backyards.

1 I wonder whether that's the best use of water. But that
2 is a form of greenbelting, isn't it?

3 MR. RUDELL: That's correct. In fact, open
4 water areas are going to have the greatest effect on the
5 air temperature surrounding them because they evaporate
6 the most water. And depending on your perspective, that
7 could be the largest waste or the largest benefit.

8 COM. NEWMAN: That was the last thing I wanted
9 to talk to you about. I guess, because we were talking
10 about it, I think we can talk all day about this, but is
11 that a waste or is that a benefit? When I see it, it
12 feels like a waste. But you are telling me I am being
13 anti-intuitive, it may actually have a benefit in some
14 way.

15 MR. RUDELL: Commissioner, I think the
16 question, the research question that needs to get
17 answered and a possible policy question is whether we
18 can and whether we should use that type of water
19 evaporation for public benefits on a citywide scale,
20 because that would benefit everyone. And in that sense
21 it would not be a waste.

22 If you are looking at an economic sense, you
23 could compute those trade-offs in terms of the costs of
24 electricity and water. You might also have some
25 positive externalities, meaning benefits occurring to

1 other areas. For example, if we are applying water to
2 the city and avoiding power generation outside the city
3 and that frees up water in those other areas, it might
4 allow greater stream flows, for instance, riparian
5 areas.

6 So it is a complicated system and that's why
7 very detailed and thorough work like you saw from
8 Dr. Pasqualetti needs to be done. But it is a very
9 interesting question. And I think you are raising some
10 interesting issues.

11 COM. NEWMAN: And it is the externalities of
12 that, the values. You have to put money value on that
13 cost of water. Right now it is relatively cheap. I
14 think like the price of gas, it would probably go up,
15 with the change of temperatures, water might go up as
16 well.

17 So that, so the externality values could change
18 over time if greenhouse gases exacerbate our water
19 situation, is that right?

20 MR. RUDELL: Commissioner, I would agree.

21 COM. NEWMAN: The only last thing I would say,
22 there is a place in Maryland, greenbelt in Maryland, in
23 Columbia, Maryland, where they actually did what you are
24 kind of talking about. They made little areas in town
25 full of trees and grass and other areas that use more

1 conserve -- conserve more water. But in general those
2 towns that have these greenbelts are, you know, the
3 nicest places to live. And like you said, they even
4 have an effect of keeping water in and maybe retaining
5 some of those creeks that run in those areas. So there
6 is something about actually maintaining riparian areas
7 that you are talking about, isn't it? Could be.

8 MR. RUDELL: I think that's a possible
9 connection. It is, a riparian area could be used as a
10 tool, as a policy tool for achieving this air
11 temperature reduction in much the same way as a turf
12 area or tree area could.

13 COM. NEWMAN: One last thing. On the CAP canals
14 that go all through this city, and water is evaporating
15 all the time out of them, is there something that the
16 CAP planners can be doing to sort of make it not cooler
17 but, you know, cool, cooler in Tucson by using that
18 water in some way, or is that a question you have ever
19 thought about?

20 MR. RUDELL: I haven't thought about it or
21 studied about it so I should probably not comment on it.

22 COM. NEWMAN: I saw a plan to have areas of the
23 CAP canal as it rolls through places like Indian School
24 and northern Phoenix as a place where there can be solar
25 and places to sit outside and just enjoy the coolness of

1 the CAP canal. Interesting, though.

2 MR. RUDDELL: I think so.

3 COM. NEWMAN: Thank you.

4 CHMN. MAYES: Thank you, Professor Ruddell,
5 appreciate you being here. And was it Professor Gober
6 that you had mentioned has written on this topic?

7 MR. RUDDELL: That's correct.

8 CHMN. MAYES: I would, we would love to see her
9 work and work that you come up with as a result of this
10 study that you are currently undertaking, if you would
11 be so kind as to send that to us.

12 MR. RUDDELL: Madam Chair, I will send you two
13 specific papers, maybe a few others.

14 CHMN. MAYES: Great. That would be terrific.
15 Thank you very much.

16 COM. NEWMAN: You have been great. Thank you.

17 MR. RUDDELL: Thank you.

18 CHMN. MAYES: Okay. So, colleagues, we are
19 almost done. Why don't we call for public comment or a
20 response to anything we have said so far.

21 I don't know. Does anybody want to say anything
22 about what we said so far? Yes, Mr. Walker.

23 If we could get him a microphone, that would be
24 great.

25 MR. WALKER: I can walk up.

1 CHMN. MAYES: Oh, great. Thanks, Paul.

2 MR. WALKER: Thank you. Paul Walker, Insight
3 Consulting, Phoenix, Arizona. I just wanted to respond
4 to one thing Professor Pasqualetti referenced.

5 He said Arizona exports about 29,000 acre feet a
6 year of water for electricity. And he uses the analogy
7 that would be approximately what Tempe uses. Tempe's
8 most recent resource plan for 2006 says, quote, Tempe's
9 2010 water demand is about 65,000 acre feet per year.
10 And analogies are important. They stick in our head.
11 So I wanted to clarify the record on that point.

12 CHMN. MAYES: Okay.

13 MR. WALKER: Thank you.

14 CHMN. MAYES: Thank you, Paul. Would anyone
15 else like to make any comments on what was, what we have
16 talked about this afternoon?

17 (No response.)

18 CHMN. MAYES: Okay. We don't have all the
19 Commissioners. Several Commissioners had to leave early
20 today. But I just want to throw something, an idea out
21 there. We do have several utilities still in the room.
22 So maybe if I could just offer this idea, this thought
23 for the bench and for the utilities to think about.

24 I thought it was a fascinating day. And all of
25 our workshops are productive, but I thought this one was

1 particularly productive in the sense of providing
2 information and, at least in my mind, sharpening the
3 notion that we can put a price on water. And I think we
4 can do it pretty easy. Of all the externalities that we
5 have, I think water is going to be the easiest one to
6 price.

7 So, and I am personally interested, I mean I
8 think we should have done this before now, and I am
9 personally interested in seeing this be done and be done
10 in a way that's timely enough for our 2011
11 implementation plans. So let me propose that we
12 continue to work on externalities, have these
13 externalities workshops. But I would like to see the
14 utilities engage in the next 60 days a process by which
15 they propose a price for water, for the externality that
16 is water, or put it another way, an externality price of
17 water --

18 COM. NEWMAN: Monetization.

19 CHMN. MAYES: -- a monetization of water, and
20 allow input from other stakeholders.

21 So I guess the process that I am proposing to my
22 colleagues and to the stakeholders is that you engage in
23 a process that is similar to one that is being used in
24 our BTA process by which you would work together and
25 propose a number to the Commission. That would be plan

1 A.

2 Plan B would be a very much more extensive and
3 Commission supervised workshop process and Commission
4 driven process.

5 So that's something probably that we would need
6 to discuss. I would like you to just think about that.
7 And if we, if we need to, we can put it, probably would
8 need to put it back on a Staff meeting so we can all
9 talk about that.

10 Yes, Ms. Ormond, is there something you would
11 like to say? And actually I would like to get the
12 feedback of stakeholders and the utilities to this idea.

13 MS. ORMOND: Just a clarifying question.

14 CHMN. MAYES: If you could grab the mike,
15 because on the off chance that someone is still
16 listening to us out there.

17 MS. ORMOND: Madam Chair, Amanda Ormond,
18 Interwest Energy Alliance. A clarifying question. 60
19 days and showing a price of water to show up in the
20 integrated resource plans that will be filed?

21 CHMN. MAYES: No. I was thinking -- good
22 question -- although it would be in the IRPs, but also
23 the energy efficiency implementation plans and renewable
24 energy implementation plans, especially the EE cost
25 test. We heard from, and I believe this is true,

1 Mr. Schlegel pointed out that some of those tests
2 current -- some of those programs currently have a zero
3 cost of water, which is ridiculous.

4 MS. ORMOND: Right. And any guidance from the
5 bench how that would be calculated or what types,
6 avoidance of water?

7 CHMN. MAYES: No. I am going to leave that to
8 you to think about. But that's something I think that I
9 am looking for feedback from folks. And I see people
10 putting their heads together.

11 MS. ORMOND: Okay.

12 CHMN. MAYES: Mr. Schlegel.

13 MR. SCHLEGEL: Jeff Schlegel, SWEEP. Thank you,
14 Madam Chair, Commissioners.

15 We would support that, that approach. I think
16 it is a good approach to try to have an informal process
17 where people can work together and bring something to
18 the Commission. I know the Commission has a lot on its
19 agenda. So do the utilities and so do many
20 stakeholders. A formal workshop process could also work
21 but it might actually be faster to do an informal
22 process and bring something before the Commission that
23 the Commission can chew on in terms of, you know, of a
24 proposal.

25 I very much like that idea. I like that you

1 have included the opportunity for stakeholders to have
2 input into that process but the utilities to have the
3 responsibility to bring you something. That sounds like
4 the right balance to me on the input side of the --
5 side.

6 And we would really, SWEEP would like to
7 encourage the Commission to have these values certainly
8 show up in whatever dockets or proceedings are coming
9 before you where they are relevant. Definitely the
10 energy efficiency implementation plans could be
11 considered for things like the renewable energy
12 implementations, the next round of those, you know,
13 and/or the resource planning processes. I am not sure
14 which one that will be first for which utility but we
15 would encourage moving forward with it, again, moving
16 off of zero, moving forward to some value for water that
17 could be included in those proceedings. Thank you.

18 CHMN. MAYES: Yeah, Commissioner Newman.

19 COM. NEWMAN: I also, I second your idea and
20 your proposal. What I was going to say was that I was
21 going to say something about how this started out.

22 I was talking to a gentleman the other day who
23 used to be on the Commission, Mr. Jennings. And this
24 was supposed to be taken up by the Commission. The
25 subject of externalities and costing was supposed to be

1 done, not supposed to be done, was going to be done in
2 the late 1990s and everything sort of dropped out after
3 the deregulation plan went through the legislature. And
4 the Commission dropped it from its agenda. So I think
5 that this whole discussion is sort of ten years overdue.

6 And so while your proposal is quicker than I
7 thought, I back you on your idea that water is a very,
8 very important variable that we should look at quickly
9 and/or at least just think about quickly. You know,
10 coming up with the exact monetization can be very
11 complex. And I am -- you know. But I look forward to
12 the process. But I see some people in the room a little
13 surprised. To be honest with you, I am surprised at
14 your proposal. But I back you and instinctively think
15 we should talk about it quickly as opposed to, you know,
16 five years from now, because we are already ten years
17 behind.

18 CHMN. MAYES: I think you make a good point,
19 Commissioner Newman, that this has been a ten-year-old
20 discussion. And I wouldn't make this proposal, you
21 know, I didn't come in today thinking I was going to
22 make this proposal, to be honest with you. It was
23 really the discussion that we had this morning and
24 frankly something that Mr. Guldner said that just sort
25 of turned the light bulbs on for me. When he said that,

1 you know, that this is truly the externality that is
2 easiest to price, I thought, well, you know, I mean the
3 utilities think it can be done, then it could probably
4 be done. And if the utilities are willing to say that
5 it can be done, then it could probably be done.

6 So I would like to start out by giving the
7 utilities and the stakeholders the opportunity to do
8 this. And if they can't get it done or if they don't
9 want to, which I doubt that that would be the case, but
10 if they don't, then the Commission can drive the bus.
11 But I would like to -- we have always -- I think the
12 processes that have moved forward this way in my tenure
13 with the Commission have always been best when it is --
14 it has always been best when it has been done that way.
15 And that's what I would propose.

16 Now, maybe we should bring this back to a Staff
17 meeting discussion because we don't have a full
18 complement of Commissioners here to talk about this.
19 But, you know, I am not talking about carbon right now.
20 We will get to that, I am sure, at some point. I am not
21 talking about NOx or SOx or mercury or those emissions.
22 I am just talking about water right now, just water.
23 And I think that's something that we can bite off little
24 bite sized, a little bite that we can chew right now and
25 get done maybe in the next few months. So that's what I

1 would propose.

2 And, Mr. Dion, do you want to give us your
3 thoughts?

4 MR. DION: Absolutely, Madam Chair,
5 Commissioners. And Phil Dion, for the record, UniSource
6 Energy.

7 I think the discussion also highlights something
8 that goes back ten years as well. And that's the
9 integrated resource process. The Commission also got
10 away from that as well. And I think that some of these
11 discussions are incredibly relevant in that process
12 because there you do get all the stakeholders. You get
13 the utilities. You get everybody involved. You get the
14 Commission involved and everybody becomes engaged and we
15 begin to understand what the resources are going to look
16 like in the future with some of the rules of the road,
17 not all of them, but with some of the rules of the road
18 that are there.

19 And one of the things that we have encountered
20 especially in energy efficiency is the societal cost
21 test. And there is a difference of opinion as to what
22 that societal cost test is and isn't. And I think once
23 we figure out what that true societal cost is, which
24 includes various elements that the Commission talked
25 about for instance today, it does or it doesn't, once we

1 go there we will be able to put together programs and
2 resources, and not make a prudent review of but to say,
3 yes, this is the direction that we think Arizona should
4 go into. And from that the utilities can make some
5 informed choices.

6 So I think going back all the way to that, I
7 think that's a crucial thing. And I am glad this
8 Commission has taken this up again, because that is
9 extremely important.

10 The one thing I would point out just for your
11 consideration, Commissioners, if you do discuss this in
12 a Staff meeting, I would just establish a docket. I
13 would establish ways to intervene or participate.
14 Because the last thing I want to do is get through a
15 process like this and find out a party who was
16 interested didn't have that opportunity or didn't know
17 about it. I think we do want to have those discussions
18 and we want to have it in a way that everyone can submit
19 information into a docket or be a participant. Because
20 when we talk about having something in 60 days, I want
21 to make sure that we are able to get all the folks that
22 we have to in Tucson or up in Kingman or wherever we are
23 going to have these discussions, and that we don't --
24 and at least we give people the opportunity, I can't
25 make sure everyone will participate, but just that

1 opportunity. So just a procedural mechanism, Madam
2 Chair, would be my suggestion so that we can get moving
3 on that.

4 And then from that, from that decision from the
5 Commission, then those stakeholders can get in touch
6 with each other and participate and get to that ultimate
7 result or that beginning point that the Commission is
8 interested in.

9 CHMN. MAYES: Okay. Thank you, Mr. Dion, for
10 that suggestion.

11 Mr. Dinkel.

12 MR. DINKEL: Thank you, Chairman Mayes,
13 Commissioners. Pat Dinkel from APS.

14 Chairman, Commissioners, I will echo a few
15 comments that have been made. I certainly appreciate
16 the expediency and interest. I will tell you from APS'
17 perspective, we were very much looking forward to these
18 workshops, as well as a number of other workshops,
19 proceedings as well, and our own workshops that we are
20 holding starting with April 22nd on a resource planning
21 process to really inform us on the right sort of both
22 analysis as well as sentiment on these various topics.

23 So probably my primary concern with the 60-day
24 window is it would almost force us to put forth a fair
25 ly expedited position on this, that, quite honestly, I

1 was looking for a little bit more informal. I thought
2 today was very helpful. But I think some of the
3 trade-offs we were talking about and the urban island is
4 a good example. You are trading off everything, you
5 know, water to comfort to electricity to jobs. There is
6 a lot of complex trade-offs here. And I would like to
7 see that vetted through a public process. And I am
8 afraid if we try to jump start in 60 days, I am afraid
9 it would be a little too fast, and I don't want it to be
10 a utility led initiative that we are kind of trying to
11 force down. So I like the point of let's go through a
12 little bit more of a public process, have a little bit
13 more discussion on this.

14 You know, obviously we are always bringing up
15 the trade-off between the various resources and customer
16 impacts. I know you care about that. I know you want
17 to see that. Adding water, as we talked about today,
18 doesn't just reduce a gap potentially between
19 conventional and renewables. It could also raise the
20 cost of renewables and conventional that use a steam
21 cooling process. So we would like to be able to make
22 sure we vet all these different issues.

23 60 days in a utility led process is just not
24 what I had in mind coming in today. But certainly I am
25 interested in trying to put some cooperation in that and

1 prefer to do it more in a little more public process.

2 CHMN. MAYES: I wasn't suggesting anything but a
3 public process. I was just suggesting one that didn't
4 take a year. I just don't think we need to take a year.
5 I think it is outlandish that we don't have a cost, a
6 price for water built into all of our energy efficiency
7 programs.

8 And I totally agree with you, Mr. Dinkel, about,
9 you know, the fact that we need to think about some of
10 those sorts of issues that are at the 80,000 foot level.
11 But I don't know what that has to do with putting a
12 price on water and calculating that into or injecting
13 that into our energy efficiency cost test.

14 You know, you would agree with me that having a
15 zero cost of water is ridiculous, wouldn't you?

16 MR. DINKEL: Well, it would be. I would argue
17 we don't have a zero cost of water because we do in fact
18 take the cost of what it takes to procure water for
19 generation. I am not trying to be difficult. It is not
20 zero. I absolutely understand the perspective that it
21 doesn't reflect the nonmonetized portion of the water
22 cost. There is no question about that. And that's
23 where it becomes a little bit of science and a whole lot
24 of art.

25 CHMN. MAYES: And we will end with this and

1 something that I think the Commissioners need to think
2 about. But I do intend on pushing this a little bit.
3 But it doesn't seem to me -- well, lost my train of
4 thought.

5 Oh, what I was suggesting was that, you know,
6 the utilities, the stakeholders gather together over the
7 next 60 days and take a first stab at it basically to
8 come up with something that the Commission could look at
9 and could vet. Then also in a public process, I wasn't
10 necessarily suggesting that we come up with the perfect
11 number, but it seems to me a number is better than no
12 number in this instance, especially when we have been
13 talking about it for a decade or more and we live in
14 Arizona, Ar-i-zo-na. So I don't know, that was just my
15 sense. We will talk about it at a forthcoming Staff
16 meeting. And I appreciate your position on that.

17 MR. DINKEL: And, Chairman, we certainly have
18 opportunity with our upcoming workshop April 22nd to
19 raise this with the stakeholders that will be there. So
20 we certainly look forward to being engaged with this and
21 obviously do it in the way that meets all our needs.

22 CHMN. MAYES: Let me ask you this. How do even
23 do an integrated resource plan without monetizing water,
24 without having a monetization of water?

25 MR. DINKEL: There is no question that there is

1 some very important assumptions on what it cost the
2 various things.

3 The other issue is, and, you know, I will say,
4 while I have a finance background, I am one of the first
5 people to say you can't monetize, try to put dollars on
6 everything. You become too mechanistic and it misses
7 the real value of what we do as human beings.

8 And so I look at anything that we do, as I have
9 talked to you and the other Commissioners over the years
10 about our procurement on generation, I will be one of
11 the first to say you cannot try to just try to look at
12 the numbers or dollars or pounds or whatever. And so I
13 will say, while we monetize the explicit cost of water
14 in our resource plan historically, we understand there
15 is an interest in monetizing externalities but we also
16 understand there is a whole lot of things that go into
17 resource planning that aren't just numbers and dollars.

18 CHMN. MAYES: Okay, thank you.

19 All right. Does anyone want to add anything to
20 that discussion?

21 (No response.)

22 CHMN. MAYES: No. All right. Thank you,
23 everybody, for being here. It has been a great day.
24 And we are, unless my colleagues want to add anything --

25 COM. NEWMAN: Happy Friday.

1 CHMN. MAYES: Happy Friday. We are adjourned.
